

### Description

The 5P35021 is the latest VersaClock programmable clock generator and is designed for low-power, consumer, and high-performance PCI Express applications. The 5P35021 device is a 3 PLLs architecture design; each PLL is individually programmable and allows up to 3 unique frequency outputs.

The 5P35021 has built-in unique features such as Proactive Power Saving (PPS), Performance-Power Balancing (PPB), Overshot Reduction Technology (ORT) and extreme low power DCO. An internal OTP memory allows the user to store the configuration in the device. After power up, the user can change the device register settings through the I<sup>2</sup>C interface when I<sup>2</sup>C mode is selected. It also has programmable VCO and PLL source selection to allow the user to do power-performance optimization based on the application requirements.

The device provides one single-ended output and two pairs of differential outputs that support LVCMOS, LVPECL, LVDS and LPHCSL. The low power 32.768kHz clock is supported with only less than 2μA current consumption for system RTC reference clock.

### Typical Applications

- PCIe Gen1/2/3 clock generator
- Consumer application crystal replacements
- SmartDevice, Handheld, Computing and Consumer applications

### Pin Assignment

### Features

- Configurable OE pin function as OE, PD#, PPS or DFC control function
- Configurable PLL bandwidth/minimizes jitter peaking
- PPS: Proactive Power Saving features save power during the end device power down mode
- PPB: Performance- Power Balancing feature allow user to minimum power consumption base on required performance
- DFC: Dynamic Frequency Control feature allows user to program up to 4 difference frequencies and switch dynamically
- Spread spectrum clock support to lower system EMI
- Store user configuration into OTP memory
- I<sup>2</sup>C interface

### Key Specifications

- PCIe clocks phase jitter: PCIe Gen3
- Differential clocks < 3 ps rms jitter integer range 12kHz–20MHz
- < 2μA DCO to generate 32.768kHz clock

### Output Features

- 2 DIFF outputs with configurable LPHSCL, LVDS, LVPECL, LVCMOS output pairs. 1MHz–500MHz (160MHz/ with LVCMOS mode)
- 1 LVCMOS output: 1MHz–160MHz
- Maximum 5 LVCMOS outputs as 1 × SE + 2 × DIFF\_T/C as LVCMOS
- Low Power 32.768kHz clock supported on SE1

## Device Feature and Function

### DFC–Dynamic Frequency Control

- OTP program (Only) setup 4 different feedback fractional divider (4 VCO frequencies) that apply to PLL2
- ORT (overshoot reduction) function will be applied automatically during the VCO frequency change
- Smooth frequency incremental or decremental from current VCO to targeted VCO base on DFC hardware pins selection

\* 5P35021 has only OE1 pin for DFC function hardware pin selection. For OE1/OE3 two pins DFC control, use 5P35023 24-QFN package device.

### DFC Function Programming

- Register B63b3:2 select DFC00–DFC11 configuration.
- Byte16–19 are the register for PLL2 VCO setting, base on B63b3:2 configuration selection, the data write to B16–19 will be store in selected configuration OTP memory.
- Refer to DFC function priority table, select proper control pin(s) to activate DFC function.
- Note the DFC function can also be controlled by I<sup>2</sup>C access.

## PPS–Proactive Power Saving Function

PPS Proactive Power Saving is an IDT patented unique design for the clock generator that proactively detects end device power down state and then switches output clocks between the normal operation clock frequency and the low power mode 32kHz clock that only consume  $< 2\mu\text{A}$  current. The system could save power when the device goes into power down or sleep mode. The PPS function diagram is shown below.

### PPS Function Block Diagram

### PPS Assertion/Deassertion Timing Chart

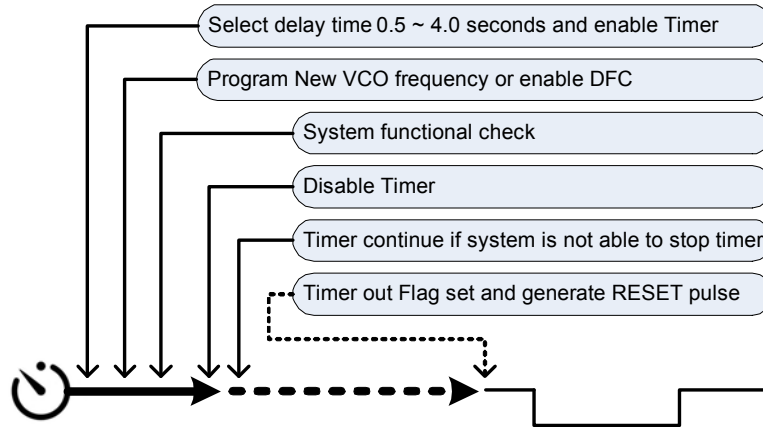

### PPS Function Programming

- Refer to OE\_pin\_function\_table to have proper PPS function selected for OE pin(s), please note that register default is set to Output enable (OE).
- Have proper setup to Byte 30 and 32 for OE1~OE3 function selection, for PPS function, select 10 to control register bits.

## Timer Function Description

1. The timer function can be used together with the DFC (Dynamic Frequency Control) function or with another PLL frequency programming.
2. The timer provides 4 different delay times by two bits selection: 0.5 seconds, 1 seconds, 2 seconds, 4 seconds.
3. The timeout flag will be set when timer times out, and the flag can be cleared by writing 0 to timer enable bit.
4. When timer times out, RESET pin (available in 5P35023) can generate a 250ms pulse signal if RESET control bit is enabled.
5. When timer times out, DFC stage will switch back to DFC00 setting if DFC function is enabled and DFC function will be disabled after RESET.

## OE Pin Function

OE pins in the 5P35021 have multiple functions. The OE pins can be configured as output enable control (OE) or chip power down control (PD#) or Proactive Power Saving function (PPS). Furthermore, the OE pins can be configured as single or two pin dynamic Frequency control (DFC), or the RESET out function that is associated with the Timer function.

## Reference Input and Selection

The 5P35021 accepts crystal input or LVCMOS/Differential clocks input by external AC coupling. See below reference circuit for details.

### Crystal Input (X1/X2)

The crystal oscillators should be fundamental mode quartz crystals; overtone crystals are not suitable. Crystal frequency should be specified for parallel resonance with 40MHz maximum.

A crystal manufacturer will calibrate its crystals to the nominal frequency with a certain load capacitance value. When the oscillator load capacitance matches the crystal load capacitance, the oscillation frequency will be accurate as 0 PPM. When the oscillator load capacitance is lower than the crystal load capacitance, the oscillation frequency will be higher than nominal. In order to get an accurate oscillation frequency, the matching the oscillator load capacitance with the crystal load capacitance is required.

To set the oscillator load capacitance, 5P35021 has built-in two programmable tuning capacitors inside the chip, one at XIN and one at XOUT. They can be adjusted independently. The value of each capacitor is composed of a fixed capacitance amount plus a variable capacitance amount set with the XTAL[7:0] register. Adjustment of the crystal tuning capacitors allows for maximum flexibility to accommodate crystals from various manufacturers. The range of tuning capacitor values available are in accordance with the following table.

## Programmable Tuning Caps Table

| Parameter  | Bits | Range          | Min (pF) | Max (pF) |
|------------|------|----------------|----------|----------|
| Xtal [7:0] | 4*2  | +1/+2/+4/+8 pF | 0        | 15pF     |

$$XTAL[4:0] = (XTAL CL - 7pF) \times 2 \quad (\text{Eq.1})$$

Equation 1 and the table of XTAL[7:0] tuning capacitor characteristics show that the parallel tuning capacitance can be set between 4.5pF to 12.5pF with a resolution of 0.25pF.

For a crystal  $C_L = 8pF$ , where  $C_L$  is the parallel capacity specified by the crystal vendor that sets the crystal frequency to the nominal value. Under the assumptions that the stray capacity between the crystal leads on the circuit board is zero and that no external tuning caps are placed on the crystal leads, then the internal parallel tuning capacity is equal to the load capacity presented to the crystal by the device.

The internal load capacitors are true parallel-plate capacitors for ultra-linear performance. Parallel-plate capacitors were chosen to reduce the frequency shift that occurs when non-linear load capacitance interacts with load, bias, supply, and temperature changes. External non-linear crystal load capacitors should not be used for applications that are sensitive to absolute frequency requirements.

## Spread Spectrum

The 5P35021 supports spread spectrum clocks from PLL1 and PLL2; the PLL1 built-in with analog spread spectrum and PLL2 has digital spread spectrum.

### Analog Spread Spectrum

Please refer to programming guide.

## Digital Spread Spectrum

$$N = \frac{F_{vco}}{2 * F_{out}}$$

$$period = \frac{F_{pfd}}{2 * F_{ss}}$$

$$step = \frac{N * SS_{amount}}{period}$$

### Down spread or Spread off

$$N = F_{vco}/F_{pfd}$$

### Center Spread

$$N = N_{soff} + N * SS_{amount}/2$$

N: include integer and fraction

F<sub>vco</sub>: vco's frequency

F<sub>pfd</sub>: PLL's pfd frequency

F<sub>ss</sub>: spread modulation rate

SS<sub>amount</sub>: spread percentage

The black line is for the down spread, N will decrease to make the center frequency is lower than spread off.

The blue line is for the center spread, there is a offset put on divider ratio to make the center frequency keep same as spread off.

Example: 0.5% down spread at 32kHz modulation rate.

## VBAT

The 5P35021 supports low-power operation 32.768kHz RTC clock with only coin cell battery supply. The coin cell battery power capacitance is usually 170mAh or higher, with less than 2 $\mu$ A\* low-power DCO operation mode will support application up to few years clock source for date/time keeping circuit (RTC).

When there is main power exist like  $V_{DD33}$  and  $V_{DDA}$ , the 5P35021 will switch DCO power source to main power to save battery power.  $V_{BAT}$  should be powered earlier or at same time with other  $V_{DD}$  power up.

### VBAT Switching Threshold

| VDD33 | VBAT | DCO power source |
|-------|------|------------------|
| >2.5V | --   | VDD33            |
| <2.3V | --   | VBAT             |

\*VBAT needs to be 3.0V~3.3V

## ORT-VCO Overshoot Reduction Technology

The 5P35021 supports innovate the VCO overshoot reduction technology (ORT) to prevent an output clock frequency spike when the device is changing frequency on the fly or doing DFC (Dynamic Frequency Control) function. The VCO frequency changes are under control instead of free-run to targeted frequency.

## Output Clock Test Conditions

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5P35021. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

|           | External single-ended reference clock CLKINB   | 1     |      | 125   |      |
|           | External differential reference clock CLKIN, CLKINB  | 8     |      | 125   |      |
| tPU       | Power up time for all VDDs to reach minimum specified voltage (power ramps must be monotonic), | 0.05  |      | 3     | ms   |

\* Power-up sequence conditions.

\* VDDSEx for non-32kHz outputs should be OFF when VDDA/VDD3 turn OFF, VBAT mode only support 32.768kHz outputs from SE1-3.

\* **VBAT power ramp up should be same or earlier than other VDD power rail.**

\* When use single-ended clock to CLKINB pin within differential clocking mode, CLKIN pin needs to be grounded and minimum input frequency should be higher than 8MHz.

\* differential clock amplitude setting 00.

Note 1: Guaranteed by design and characterization. Not 100% tested in production.

Note 2: Measured from differential waveform.

Note 3: Slew rate is measured through the VSWING voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

Note 4: VCROSS is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

Note 5: the total variation of all VCROSS measurements in any particular system. Note that this is a subset of VCROSS min/max (VCROSS absolute) allowed. The intent is to limit VCROSS induced modulation by setting ΔVCROSS to be smaller than VCROSS absolute.

Note 6: Measured from single-ended waveform.

Note 7: Measured with scope averaging off, using statistics function. Variation is difference between min. and max.

Note 8: Scope average ON.

Note: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

1. Peak-to-Peak jitter after applying system transfer function for the Common Clock Architecture. Maximum limit for PCI Express Gen 1.
2. RMS jitter after applying the two evaluation bands to the two transfer functions defined in the Common Clock Architecture and reporting the worst case results for each evaluation band. Maximum limit for PCI Express Generation 2 is 3.1ps RMS for tREFCLK\_HF\_RMS (High Band) and 3.0ps RMS for tREFCLK\_LF\_RMS (Low Band).
3. RMS jitter after applying system transfer function for the common clock architecture. This specification is based on the PCI\_Express\_Base\_r3.0 10 Nov, 2010 specification, and is subject to change pending the final release version of the specification.
4. This parameter is guaranteed by characterization. Not tested in production.

Note 1: A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIH(MIN) of the SCL signal) to bridge the undefined region of the falling edge of SCL.

## General I<sup>2</sup>C Mode Operations

The device acts as a slave device on the I<sup>2</sup>C bus using one of the four I<sup>2</sup>C addresses (0xD0, 0xD2, 0xD4, or 0xD6) to allow multiple devices to be used in the system. The interface accepts byte-oriented block write and block read operations. Two address bytes specify the register address of the byte position of the first register to write or read. Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first). Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I<sup>2</sup>C compliance, it is recommended to use external pull-up resistors for SDATA and SCLK. The internal pull-down resistors have a size of 100kΩ typical.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
