

FEATURES

Supply range

2.8 V to 15 V, ADR291

4.4 V to 15 V, ADR292

Supply current: 15 μ A maximum

Low noise: 8 μ V and 12 μ V p-p (0.1 Hz to 10 Hz)

High output current: 5 mA

Temperature range: -40°C to $+125^{\circ}\text{C}$

Pin-compatible with REF02/REF19x

APPLICATIONS

Portable instrumentation

Precision reference for 3 V and 5 V systems

Analog-to-digital and digital-to-analog converter reference

Solar-powered applications

Loop-current-powered instruments

GENERAL DESCRIPTION

The ADR291 and ADR292 are low noise, micropower precision voltage references that use an XFET[®] reference circuit. The new XFET architecture offers significant performance improvements over traditional band gap and buried Zener-based references. Improvements include one quarter the voltage noise output of band gap references operating at the same current, very low and ultralinear temperature drift, low thermal hysteresis, and excellent long-term stability.

The ADR291/ADR292 family is a series of voltage references providing stable and accurate output voltages from supplies as low as 2.8 V for the ADR291. Output voltage options are 2.5 V and 4.096 V for the ADR291 and ADR292, respectively.

Quiescent current is only 12 μ A, making these devices ideal for battery-powered instrumentation. Three electrical grades are available offering initial output accuracies of ± 2 mV, ± 3 mV, and ± 6 mV maximum for the ADR291, and ± 3 mV, ± 4 mV, and ± 6 mV maximum for the ADR292. Temperature

coefficients for the three grades are 8 ppm/ $^{\circ}\text{C}$, 15 ppm/ $^{\circ}\text{C}$, and 25 ppm/ $^{\circ}\text{C}$ maximum, respectively. Line regulation and load regulation are typically 30 ppm/V and 30 ppm/mA, maintaining the reference's overall high performance. For a device with 5.0 V output, refer to the ADR293 data sheet.

The ADR291 and ADR292 references are specified over the extended industrial temperature range of -40°C to $+125^{\circ}\text{C}$. Devices are available in the 8-lead SOIC, 8-lead TSSOP, and 3-lead TO-92 packages.

Table 1. ADR291/ADR292 Product

Part No.	Output Voltage (V)	Initial Accuracy ($\pm\%$)	Temperature Coefficient (ppm/ $^{\circ}\text{C}$) Max
ADR291	2.500	0.08, 0.12, 0.24	8, 15, 25
ADR292	4.096	0.07, 0.10, 0.15	8, 15, 25

ABSOLUTE MAXIMUM RATINGS

Remove power before inserting or removing units from their sockets.

Table 8.

Parameter	Rating
Supply Voltage	18 V
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range T, R, RU Packages	-65°C to +150°C
Operating Temperature Range ADR291/ADR292	-40°C to +125°C
Junction Temperature Range T, R, RU Packages	-65°C to +125°C
Lead Temperature (Soldering, 60 sec)	300°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 9. Package Types

Package Type	θ_{JA}^1	θ_{JC}	Unit
8-Lead SOIC (R)	158	43	°C/W
8-Lead TSSOP (RU)	240	43	°C/W
3-Lead TO-92 (T)	160	-	°C/W

¹ θ_{JA} is specified for worst-case conditions. For example, θ_{JA} is specified for a device in socket testing. In practice, θ_{JA} is specified for a device soldered in the circuit board.

Table 10. Other XFET Products

Part Number	Nominal Output Voltage (V)	Package Type
ADR420	2.048	8-Lead MSOP/SOIC
ADR421	2.50	8-Lead MSOP/SOIC
ADR423	3.0	8-Lead MSOP/SOIC
ADR425	5.0	8-Lead MSOP/SOIC

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TERMINOLOGY

Line Regulation

Line regulation refers to the change in output voltage due to a specified change in input voltage. It includes the effects of self-heating. Line regulation is expressed as percent-per-volt, parts-per-million-per-volt, or microvolts-per-volt change in input voltage.

Load Regulation

The change in output voltage is due to a specified change in load current and includes the effects of self-heating. Load regulation is expressed in microvolts-per-milliampere, parts-per-million-per-milliampere, or ohms of dc output resistance.

Long-Term Stability

Long-term stability refers to the typical shift of output voltage at 25°C on a sample of parts subjected to a test of 1000 hours at 125°C.

$$\Delta V_{OUT} = V_{OUT}(t_0) - V_{OUT}(t_1)$$

$$\Delta V_{OUT} [\text{ppm}] = \frac{V_{OUT}(t_0) - V_{OUT}(t_1)}{V_{OUT}(t_0)} \times 10^6$$

where:

$V_{OUT}(t_0)$ = V_{OUT} at 25°C at Time 0.

$V_{OUT}(t_1)$ = V_{OUT} at 25°C after 1000 hours of operation at 125°C.

Temperature Coefficient

Temperature coefficient is the change of output voltage over the operating temperature change, normalized by the output voltage at 25°C, expressed in ppm/°C. The equation follows:

$$TCV_o [\text{ppm}/^\circ\text{C}] = \frac{V_o(T_2) - V_o(T_1)}{V_o(25^\circ\text{C}) \times (T_2 - T_1)} \times 10^6$$

where:

$V_{OUT}(25^\circ\text{C})$ = V_{OUT} at 25°C.

$V_{OUT}(T_1)$ = V_{OUT} at Temperature 1.

$V_{OUT}(T_2)$ = V_{OUT} at Temperature 2.

NC = no connect.

There are internal connections at NC pins that are reserved for manufacturing purposes. Users should not connect anything at the NC pins.

Thermal Hysteresis

Thermal hysteresis is defined as the change of output voltage after the device is cycled through temperatures from +25°C to -40°C, then to +85°C, and back to +25°C. This is a typical value from a sample of parts put through such a cycle.

$$V_{OUT-HYS} = V_{OUT}(25^\circ\text{C}) - V_{OUT_TC}$$

$$V_{OUT-HYS} [\text{ppm}] = \frac{V_{OUT}(25^\circ\text{C}) - V_{OUT_TC}}{V_{OUT}(25^\circ\text{C})} \times 10^6$$

where:

$V_{OUT}(25^\circ\text{C})$ = V_{OUT} at 25°C.

V_{OUT_TC} = V_{OUT} at 25°C after temperature cycle from +25°C to -40°C, then to +85°C, and back to +25°C.

APPLICATIONS INFORMATION

HIGH VOLTAGE FLOATING CURRENT SOURCE

The circuit shown in Figure 33 can be used to generate a floating current source with minimal self-heating. This particular configuration operates on high supply voltages determined by the breakdown voltage of the N-channel JFET.

Figure 33. High Voltage Floating Current Source

KELVIN CONNECTIONS

In many portable instrumentation applications, the PC board area is directly related to cost; therefore, circuit interconnects are reduced to a minimal width. These narrow lines can cause large voltage drops if the voltage reference is required to provide load currents to various functions. In fact, circuit interconnects can exhibit a typical line resistance of 0.45 mΩ/square (1 oz. Cu, for example). Force and sense connections, also referred to as Kelvin connections, offer a convenient method of eliminating the effects of voltage drops in circuit wires. Load currents flowing through wiring resistance produce an error ($V_{\text{ERROR}} = R \times I_L$) at the load. However, the Kelvin connection shown in Figure 34 overcomes the problem by including the wiring resistance within the forcing loop of the op amp. Since the op amp senses the load voltage, the op amp loop control forces the output to compensate for the wiring error producing the correct voltage at the load.

Figure 34. Advantage of Kelvin Connection

LOW POWER, LOW VOLTAGE REFERENCE FOR DATA CONVERTERS

The ADR291/ADR292 family has a number of features that makes it ideally suited for use with analog-to-digital and digital-to-analog converters. Because of its low supply voltage, the ADR291 can be used with converters that run on 3 V supplies without having to add a higher supply voltage for the reference. The low quiescent current (12 μA maximum) and low noise, tight temperature coefficient, combined with the high accuracy of the ADR291/ADR292, make it ideal for low power applications such as handheld, battery-operated equipment.

One such ADC for which the ADR291 is well suited is the AD7701. Figure 35 shows the ADR291 used as the reference for this converter. The AD7701 is a 16-bit ADC with on-chip digital filtering intended for the measurement of wide dynamic range, low frequency signals such as those representing chemical, physical, or biological processes. It contains a charge balancing (Σ - Δ) ADC, calibration microcontroller with on-chip static RAM, a clock oscillator, and a serial communications port.

This entire circuit runs on ± 5 V supplies. The power dissipation of the AD7701 is typically 25 mW and, when combined with the power dissipation of the ADR291 (60 μW), the entire circuit still consumes about 25 mW.

Figure 35. Low Power, Low Voltage Supply Reference for the AD7701

VOLTAGE REGULATOR FOR PORTABLE EQUIPMENT

The ADR291/ADR292 family of references is ideal for providing a stable, low cost, and low power reference voltage in portable equipment power supplies. Figure 36 shows how the ADR291 and ADR292 can be used in a voltage regulator that not only has low output noise (as compared to switch mode design) and low power, but also a very fast recovery after current surges. Some precautions should be taken in the selection of the output capacitors. Too high an ESR (effective series resistance) could endanger the stability of the circuit. A solid tantalum capacitor, 16 V or higher, and an aluminum electrolytic capacitor, 10 V or higher, are recommended for C1 and C2, respectively. Also, the path from the ground side of C1 and C2 to the ground side of R1 should be kept as short as possible.

NOTES

NOTES

NOTES

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON
