HCPL-3150 (Single Channel), HCPL-315J (Dual Channel)

0.5 Amp Output Current IGBT Gate Drive Optocoupler

AVAGO TECHNOLOGIES

Data Sheet

Lead (Pb) Free
RoHS 6 fully compliant

RoHS 6 fully compliant options available;
-xxxE denotes a lead-free product

Description

The HCPL-315X consists of an LED optically coupled to an integrated circuit with a power output stage. This optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and current supplied by this optocoupler makes it ideally suited for directly driving IGBTs with ratings up to 1200 V/50 A. For IGBTs with higher ratings, the HCPL-3150/315J can be used to drive a discrete power stage which drives the IGBT gate.

Applications

- Isolated IGBT/MOSFET gate drive
- AC and brushless dc motor drives
- Industrial inverters
- Switch Mode Power Supplies (SMPS)
- Uninterruptable Power Supplies (UPS)

Features

- 0.6A maximum peak output current
- 0.5 A minimum peak output current
- 15 kV/µs minimum Common Mode Rejection (CMR) at V_{CM} = 1500 V
- 1.0 V maximum low level output voltage (V_{OL}) eliminates need for negative gate drive
- I_{CC} = 5 mA maximum supply current
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- Wide operating V_{CC} range: 15 to 30 volts
- 0.5 µs maximum propagation delay
- +/– 0.35 µs maximum delay between devices/ channels
- Industrial temperature range: -40°C to 100°C
- HCPL-315J: channel one to channel two output isolation = 1500 Vrms/1 min.
- Safety and regulatory approval:
  UL recognized (UL1577),
  3750 Vrms/1 min (HCPL-3150)
  5000 Vrms/1 min (HCPL-315J)
  IEC/EN/DIN EN 60747-5-2 approved
  V_{IORM} = 630 V_{peak} (HCPL-3150 option 060 only)
  V_{IORM} = 1230 V_{peak} (HCPL-315J) CSA certified

Functional Diagram

TRUTH TABLE

LED	V_{CC} - V_{EE} "Positive Going" (i.e., Turn-On)	V_{CC} - V_{EE} "Negative-Going" (i.e., Turn-Off)	V_O
OFF	0 - 30 V	0 - 30 V	LOW
ON	0 - 11 V	0 - 9.5 V	LOW
ON	11 - 13.5 V	9.5 - 12 V	TRANSITION
ON	13.5 - 30 V	12 - 30 V	HIGH

A 0.1 µF bypass capacitor must be connected between the V_{CC} and V_{EE} pins for each channel.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Selection Guide: Invertor Gate Drive Optoisolators

Package Type	8-Pin DIP (300 mil)				Widebody (400 mil)	Small Outline SO-16		
Part Number	HCPL-3150	HCPL-3120	HCPL-J312	HCPL-J314	HCNW-3120	HCPL-315J	HCPL-316J	HCPL-314J
Number of Channels	1	1	1	1	1	2	1	2
IEC/EN/DIN EN 60747-5-2 Approvals	V_{IORM} 630 Vpeak Option 060		V_{IORM} 1230Vpeak		V_{IORM} 1414 Vpeak	V_{IORM} 1230 Vpeak		
UL Approval	5000 Vrms/1 min.		5000 Vrms/1 min.		5000 Vrms/1min.	5000 Vrms/1 min.

Fault Status	No						Yes	No

Ordering Information

HCPL-3150 is UL Recognized with 3750 Vrms for 1 minute per UL1577. HCPL-315J is UL Recognized with 5000 Vrms for 1 minute per UL1577.

Part Number	Option		Package	Surface Mount	Gull Wing	Tape & Reel	IEC/EN/DIN EN 60747-5-2	Quantity
	RoHS Compliant	Non RoHS Compliant						
HCPL-3150	-000E	No option	300 mil DIP-8					50 per tube
	-300E	#300		x	x			50 per tube
	-500E	#500		x	x	x		1000 per reel
	-060E	#060					x	50 per tube
	-360E	#360		x	x		x	50 per tube
	-560E	#560		x	x	x	x	1000 per reel
HCPL-315J	-000E	No option	SO-16	x			x	45 per tube
	-500E	#500		x		x	x	850 per reel

To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry.

Example 1:

HCPL-3150-560E to order product of 300 mil DIP Gull Wing Surface Mount package in Tape and Reel packaging with IEC/EN/DIN EN 60747-5-2 Safety Approval in RoHS compliant.

Example 2:

HCPL-3150 to order product of 300 mil DIP package in tube packaging and non RoHS compliant.

Option datasheets are available. Contact your Avago sales representative or authorized distributor for information.

Remarks: The notation '#XXX' is used for existing products, while (new) products launched since 15th July 2001 and RoHS compliant option will use '-XXXE'.

*All typical values at T_A = 25°C and V_{CC} - V_{EE} = 30 V, unless otherwise noted.

**The Input-Output/Output-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output/output-output continuous voltage rating. For the continuous voltage rating refer to your equipment level safety specification or Avago Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

Notes:

1. Derate linearly above 70°C free-air temperature at a rate of 0.3 mA/°C.
2. Maximum pulse width = 10 µs, maximum duty cycle = 0.2%. This value is intended to allow for component tolerances for designs with I_O peak minimum = 0.5 A. See Applications section for additional details on limiting I_{OH} peak.
3. Derate linearly above 70°C free-air temperature at a rate of 4.8 mW/°C.
4. Derate linearly above 70°C free-air temperature at a rate of 5.4 mW/°C. The maximum LED junction temperature should not exceed 125°C.
5. Maximum pulse width = 50 µs, maximum duty cycle = 0.5%.
6. In this test V_{OH} is measured with a dc load current. When driving capacitive loads V_{OH} will approach V_{CC} as I_{OH} approaches zero amps.
7. Maximum pulse width = 1 ms, maximum duty cycle = 20%.
8. In accordance with UL1577, each HCPL-3150 optocoupler is proof tested by applying an insulation test voltage ≥4500 Vrms (≥ 6000 Vrms for the HCPL-315J) for 1 second. This test is performed before the 100% production test for partial discharge (method b) shown in the IEC/EN/DIN EN 60747-5-2 Insulation Characteristics Table, if applicable.
9. Device considered a two-terminal device: pins on input side shorted together and pins on output side shorted together.
10. The difference between t_{PHL} and t_{PLH} between any two parts or channels under the same test condition.
11. Pins 1 and 4 (HCPL-3150) and pins 3 and 4 (HCPL-315J) need to be connected to LED common.
12. Common mode transient immunity in the high state is the maximum tolerable $|dV_{CM}/dt|$ of the common mode pulse, V_{CM}, to assure that the output will remain in the high state (i.e., V_O > 15.0 V).
13. Common mode transient immunity in a low state is the maximum tolerable $|dV_{CM}/dt|$ of the common mode pulse, V_{CM}, to assure that the output will remain in a low state (i.e., V_O < 1.0 V).
14. This load condition approximates the gate load of a 1200 V/25 A IGBT.
15. Pulse Width Distortion (PWD) is defined as $|t_{PHL}-t_{PLH}|$ for any given device.
16. Each channel.
17. Device considered a two terminal device: Channel one output side pins shorted together, and channel two output side pins shorted together.
18. See the thermal model for the HCPL-315J in the application section of this data sheet.

Applications Information

Eliminating Negative IGBT Gate Drive

To keep the IGBT firmly off, the HCPL-3150/315J has a very low maximum V_{OL} specification of 1.0 V. The HCPL-3150/315J realizes this very low V_{OL} by using a DMOS transistor with 4 Ω (typical) on resistance in its pull down circuit. When the HCPL-3150/315J is in the low state, the IGBT gate is shorted to the emitter by Rg + 4 Ω. Minimizing Rg and the lead inductance from the HCPL-3150/315J to the IGBT gate and emitter (possibly by mounting the HCPL-3150/315J on a small PC board directly above the IGBT) can eliminate the need for negative IGBT gate drive in many applications as shown in Figure 25. Care should be taken with such a PC board design to avoid routing the IGBT collector or emitter traces close to the HCPL-3150/315J input as this can result in unwanted coupling of transient signals into the HCPL-3150/315J and degrade performance. (If the IGBT drain must be routed near the HCPL-3150/315J input, then the LED should be reverse-biased when in the off state, to prevent the transient signals coupled from the IGBT drain from turning on the HCPL-3150/315J.)

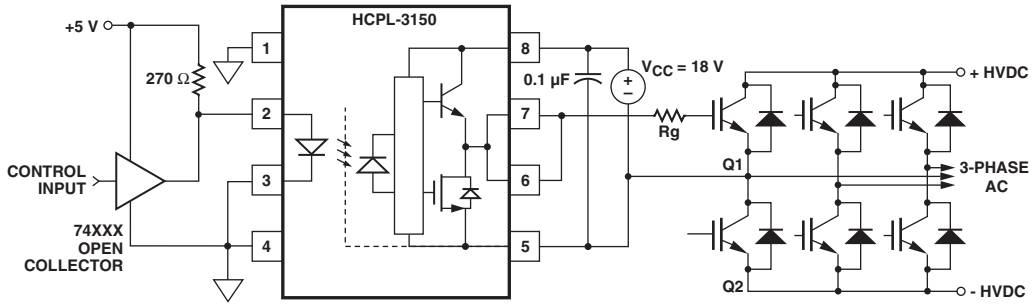

Figure 25a. Recommended LED Drive and Application Circuit.

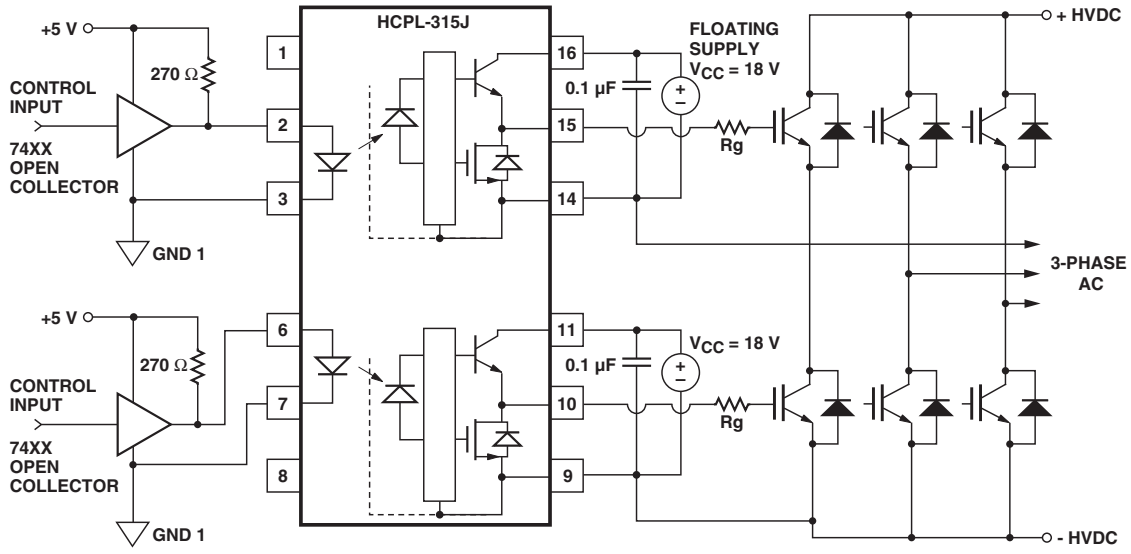

Figure 25b. Recommended LED Drive and Application Circuit (HCPL-315J)

Selecting the Gate Resistor (Rg) to Minimize IGBT Switching Losses.

Step 1: Calculate Rg Minimum From the I_{0L} Peak Specification. The IGBT and Rg in Figure 26 can be analyzed as a simple RC circuit with a voltage supplied by the HCPL-3150/315J.

$$Rg \geq \frac{(V_{CC} - V_{EE} - V_{OL})}{I_{OLPEAK}}$$

$$= \frac{(V_{CC} - V_{EE} - 1.7\ V)}{I_{OLPEAK}}$$

$$= \frac{(15\ V + 5\ V - 1.7\ V)}{0.6\ A}$$

$$= 30.5\ \Omega$$

The V_{OL} value of 2V in the previous equation is a conservative value of V_{OL} at the peak current of 0.6 A (see Figure 6). At lower Rg values the voltage supplied by the HCPL-3150/315J is not an ideal voltage step. This results in lower peak currents (more margin) than predicted by this analysis. When negative gate drive is not used V_{EE} in the previous equation is equal to zero volts.

Step 2: Check the HCPL-3150/315J Power Dissipation and Increase Rg if Necessary. The HCPL-3150/315J total power dissipation (P_T) is equal to the sum of the emitter power (P_E) and the output power (P_O):

$$P_T = P_E + P_O$$

$$P_E = I_F \cdot V_F \cdot Duty\ Cycle$$

$$P_O = P_{O(BIAS)} + P_{O\ (SWITCHING)}$$

$$= I_{CC} \cdot (V_{CC} - V_{EE}) + E_{SW}(R_G, Q_G) \cdot f$$

For the circuit in Figure 26 with I_F (worst case) = 16 mA, Rg = 30.5 Ω, Max Duty Cycle = 80%, Qg = 500 nC, f = 20 kHz and T_A max = 90°C:

$$P_E = 16\ mA \cdot 1.8\ V \cdot 0.8 = 23\ mW$$

$$P_O = 4.25\ mA \cdot 20\ V + 4.0\ \mu J \cdot 20\ kHz$$

$$= 85\ mW + 80\ mW$$

$$= 165\ mW > 154\ mW\ (P_{O(MAX)}\ @\ 90°C$$

$$= 250\ mW - 20C \cdot 4.8\ mW/C)$$

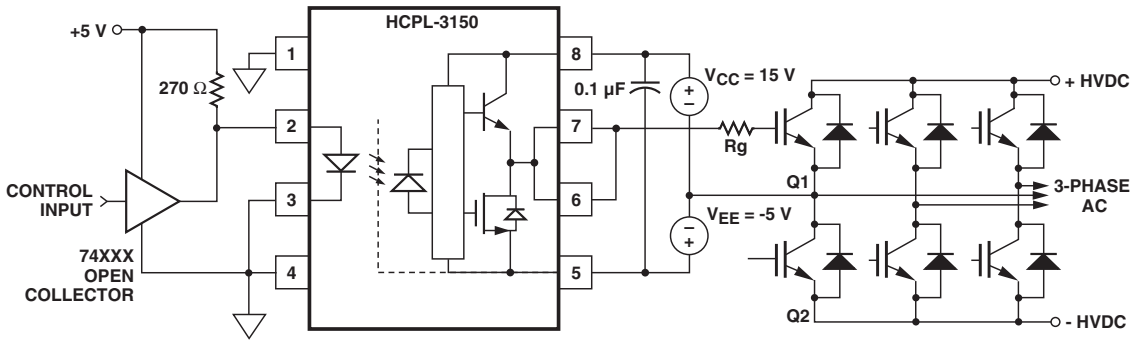

Figure 26a. HCPL-3150 Typical Application Circuit with Negative IGBT Gate Drive.

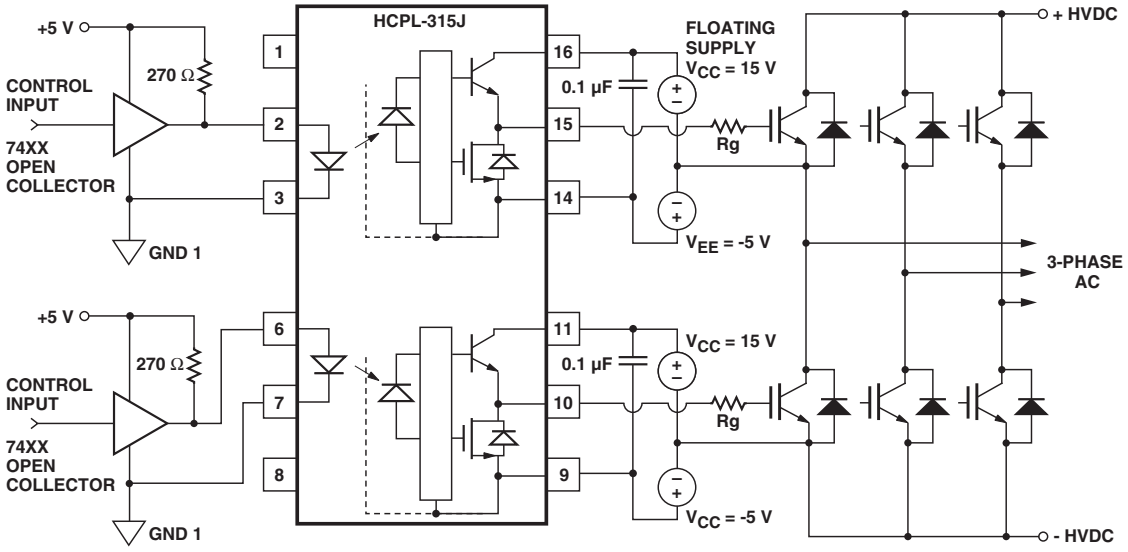

Figure 26b. HCPL-315J Typical Application Circuit with Negative IGBT Gate Drive.

P_E Parameter	Description
I_F	LED Current
V_F	LED On Voltage
Duty Cycle	Maximum LED Duty Cycle

P_O Parameter	Description
I_{CC}	Supply Current
V_{CC}	Positive Supply Voltage
V_{EE}	Negative Supply Voltage
E_{SW}(Rg,Qg)	Energy Dissipated in the HCPL-3150/315J for each IGBT Switching Cycle (See Figure 27)
f	Switching Frequency

The value of 4.25 mA for I_{CC} in the previous equation was obtained by derating the I_{CC} max of 5 mA (which occurs at -40°C) to I_{CC} max at 90°C (see Figure 7).

Since P_O for this case is greater than $P_{O(MAX)}$, Rg must be increased to reduce the HCPL-3150 power dissipation.

$$P_{O(SWITCHING\ MAX)} = P_{O(MAX)} - P_{O(BIAS)}$$
$$= 154\ mW - 85\ mW$$
$$= 69\ mW$$

$$E_{SW(MAX)} = \frac{P_{O(SWITCHINGMAX)}}{f}$$
$$= \frac{69\ mW}{20\ kHz} = 3.45\ \mu J$$

For Qg = 500 nC, from Figure 27, a value of E_{SW} = 3.45 µJ gives a Rg = 41 Ω.

Thermal Model (HCPL-3150)

The steady state thermal model for the HCPL-3150 is shown in Figure 28a. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. As shown by the model, all heat generated flows through θ_{CA} which raises the case temperature T_C accordingly. The value of θ_{CA} depends on the conditions of the board design and is, therefore, determined by the designer. The value of θ_{CA} = 83°C/W was obtained from thermal measurements using a 2.5 x 2.5 inch PC board, with small traces (no ground plane), a single HCPL-3150 soldered into the center of the board and still air. The absolute maximum power dissipation derating specifications assume a θ_{CA} value of 83°C/W.

From the thermal mode in Figure 28a the LED and detector IC junction temperatures can be expressed as:

$$T_{JE} = P_E \cdot (\theta_{LC} \| (\theta_{LD} + \theta_{DC}) + \theta_{CA}) + P_D \cdot \left(\frac{\theta_{LC} \cdot \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right) + T_A$$

$$T_{JD} = P_E \left(\frac{\theta_{LC} \cdot \theta_{DC}}{\theta_{LC} + \theta_{DC} + \theta_{LD}} + \theta_{CA} \right) + P_D \cdot (\theta_{DC} \| (\theta_{LD} + \theta_{LC}) + \theta_{CA}) + T_A$$

Inserting the values for θ_{LC} and θ_{DC} shown in Figure 28 gives:

$$T_{JE} = P_E \cdot (230°C/W + \theta_{CA}) + P_D \cdot (49°C/W + \theta_{CA}) + T_A$$

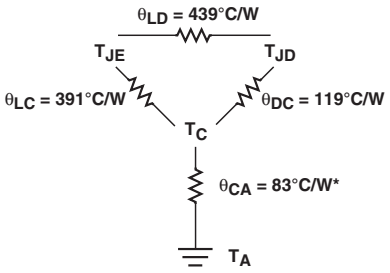
$$T_{JD} = P_E \cdot (49°C/W + \theta_{CA}) + P_D \cdot (104°C/W + \theta_{CA}) + T_A$$

For example, given P_E = 45 mW, P_O = 250 mW, T_A = 70°C and θ_{CA} = 83°C/W:

$$T_{JE} = P_E \cdot 313°C/W + P_D \cdot 132°C/W + T_A$$
$$= 45\ mW \cdot 313°C/W + 250\ mW \cdot 132°C/W + 70°C = 117°C$$

$$T_{JD} = P_E \cdot 132°C/W + P_D \cdot 187°C/W + T_A$$
$$= 45\ mW \cdot 132C/W + 250\ mW \cdot 187°C/W + 70°C = 123°C$$

T_{JE} and T_{JD} should be limited to 125°C based on the board layout and part placement (θ_{CA}) specific to the application.



T_{JE} = LED junction temperature
T_{JD} = detector IC junction temperature
T_C = case temperature measured at the center of the package bottom
θ_{LC} = LED-to-case thermal resistance
θ_{LD} = LED-to-detector thermal resistance
θ_{DC} = detector-to-case thermal resistance
θ_{CA} = case-to-ambient thermal resistance
*θ_{CA} will depend on the board design and the placement of the part.

Thermal Model Dual-Channel (SOIC-16) HCPL-315J Optoisolator

Definitions

θ_1, θ_2, θ_3, θ_4, θ_5, θ_6, θ_7, θ_8, θ_9, θ_{10}: Thermal impedances between nodes as shown in Figure 28b. Ambient Temperature: Measured approximately 1.25 cm above the optocoupler with no forced air.

Description

This thermal model assumes that a 16-pin dual-channel (SOIC-16) optocoupler is soldered into an 8.5 cm x 8.1 cm printed circuit board (PCB). These optocouplers are hybrid devices with four die: two LEDs and two detectors. The temperature at the LED and the detector of the optocoupler can be calculated by using the equations below.

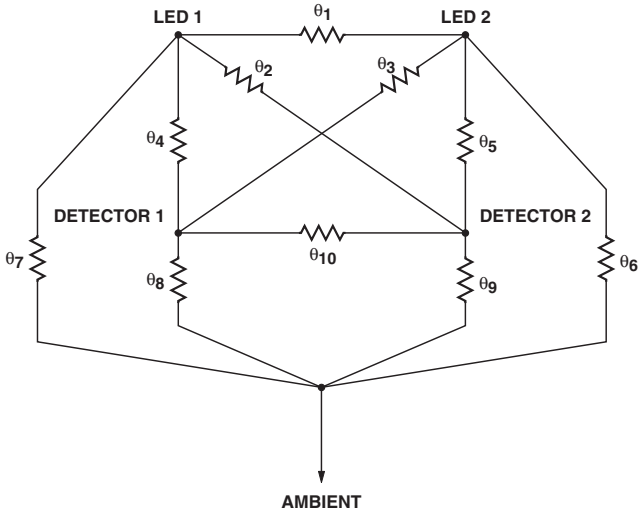

Figure 28b. Thermal Impedance Model for HCPL-315J.

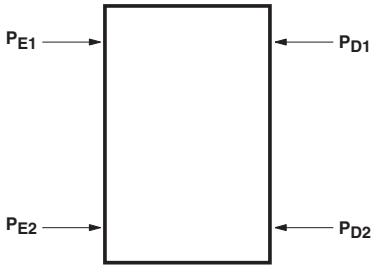
$$\Delta T_{E1A} = A_{11}P_{E1} + A_{12}P_{E2} + A_{13}P_{D1} + A_{14}P_{D2}$$

$$\Delta T_{E2A} = A_{21}P_{E1} + A_{22}P_{E2} + A_{23}P_{D1} + A_{24}P_{D2}$$

$$\Delta T_{D1A} = A_{31}P_{E1} + A_{32}P_{E2} + A_{33}P_{D1} + A_{34}P_{D2}$$

$$\Delta T_{D2A} = A_{41}P_{E1} + A_{42}P_{E2} + A_{43}P_{D1} + A_{44}P_{D2}$$

where:



ΔT_{E1A} = Temperature difference between ambient and LED 1
ΔT_{E2A} = Temperature difference between ambient and LED 2
ΔT_{D1A} = Temperature difference between ambient and detector 1
ΔT_{D2A} = Temperature difference between ambient and detector 2
P_{E1} = Power dissipation from LED 1;
P_{E2} = Power dissipation from LED 2;
P_{D1} = Power dissipation from detector 1;
P_{D2} = Power dissipation from detector 2
A_{xy} thermal coefficient (units in °C/W) is a function of thermal impedances θ_1 through θ_{10}.

Note: Maximum junction temperature for above part: 125°C.

LED Drive Circuit Considerations for Ultra High CMR Performance

Without a detector shield, the dominant cause of optocoupler CMR failure is capacitive coupling from the input side of the optocoupler, through the package, to the detector IC as shown in Figure 29. The HCPL-3150/315J improves CMR performance by using a detector IC with an optically transparent Faraday shield, which diverts the capacitively coupled current away from the sensitive IC circuitry. How ever, this shield does not eliminate the capacitive coupling between the LED and optocoupler pins 5-8 as shown in Figure 30. This capacitive coupling causes perturbations in the LED current during common mode transients and becomes the major source of CMR failures for a shielded optocoupler. The main design objective of a high CMR LED drive circuit becomes keeping the LED in the proper state (on or off) during common mode transients. For example, the recommended application circuit (Figure 25), can achieve 15 kV/µs CMR while minimizing component complexity.

Techniques to keep the LED in the proper state are discussed in the next two sections.

CMR with the LED On (CMR_H)

A high CMR LED drive circuit must keep the LED on during common mode transients. This is achieved by overdriving the LED current beyond the input threshold so that it is not pulled below the threshold during a transient. A minimum LED current of 10 mA provides adequate margin over the maximum I_{FLH} of 5 mA to achieve 15 kV/µs CMR.

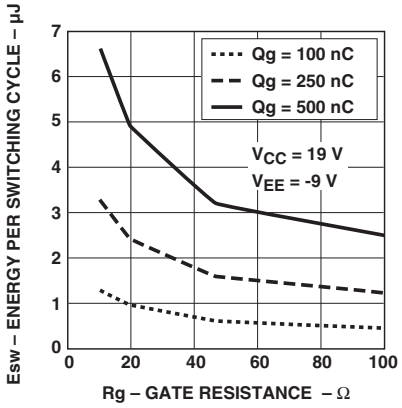

Figure 27. Energy Dissipated in the HCPL-3150 for Each IGBT Switching Cycle.

CMR with the LED Off (CMR_L)

A high CMR LED drive circuit must keep the LED off ($V_F \le V_{F(OFF)}$) during common mode transients. For example, during a $-dV_{CM}/dt$ transient in Figure 31, the current flowing through C_{LEDP} also flows through the R_{SAT} and V_{SAT} of the logic gate. As long as the low state voltage developed across the logic gate is less than $V_{F(OFF)}$, the LED will remain off and no common mode failure will occur.

The open collector drive circuit, shown in Figure 32, cannot keep the LED off during a $+dV_{CM}/dt$ transient, since all the current flowing through C_{LEDN} must be supplied by the LED, and it is not recommended for applications requiring ultra high CMR_L performance. Figure 33 is an alternative drive circuit which, like the recommended application circuit (Figure 25), does achieve ultra high CMR performance by shunting the LED in the off state.

Under Voltage Lockout Feature

The HCPL-3150/315J contains an under voltage lockout (UVLO) feature that is designed to protect the IGBT under fault conditions which cause the HCPL-3150/315J supply voltage (equivalent to the fully-charged IGBT gate voltage) to drop below a level necessary to keep the IGBT in a low resistance state. When the HCPL-3150/315J output is in the high state and the supply voltage drops below the HCPL-3150/315J V_{UVLO-} threshold ($9.5 < V_{UVLO-} < 12.0$), the optocoupler output will go into the low state with a typical delay, UVLO Turn Off Delay, of 0.6 µs. When the HCPL-3150/315J output is in the low state and the supply voltage rises above the HCPL-3150/315J V_{UVLO+} threshold ($11.0 < V_{UVLO+} < 13.5$), the optocoupler will go into the high state (assuming LED is "ON") with a typical delay, UVLO TURN On Delay, of 0.8 µs.

IPM Dead Time and Propagation Delay Specifications

The HCPL-3150/315J includes a Propagation Delay Difference (PDD) specification intended to help designers minimize "dead time" in their power inverter designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 25) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices from the high- to the low-voltage motor rails.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 34. The amount of delay necessary to achieve this conditions is equal to the maximum value of the propagation delay difference specification, PDD_{MAX}, which is specified to be 350 ns over the operating temperature range of -40°C to 100°C.

Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the maximum and minimum propagation delay difference specifications as shown in Figure 35. The maximum dead time for the HCPL-3150/315J is 700 ns (= 350 ns - (-350 ns)) over an operating temperature range of -40°C to 100°C.

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical IGBTs.

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).

FORSTAR®
