General Description

857145 is a RF filter for wireless infrastructure applications. This filter was specifically designed for filtering in the digital pre-distortion path in Base Station applications. This filter is designed in a 3x3mm hermetic package and is part of our wide portfolio of RF filters in the same package.

Low insertion loss, coupled with high attenuation and excellent power handling, makes this filter a natural choice for our customers Downlink RF filtering needs.

Notes:

1. All specifications are based on the TriQuint schematic shown on page 3.
2. In production, devices will be tested at room temperature to a guardbanded specification to ensure electrical compliance over temperature.
3. Electrical margin has been built into the design to account for the variations due to temperature drift and manufacturing tolerances.
4. Typical values are based on average measurements at room temperature.
5. Variation is defined as the total peak to peak variation over the defined frequency range.
6. To be measured only during engineering development.
7. Temperature Drift specification is defined on Page 3 and is guaranteed by design and won't be measured in production
8. Relative to maximum insertion loss at center frequency.
9. This is the optimum impedance in order to achieve the performance shown.

Absolute Maximum Ratings

Parameter	Rating
Operable Temperature	-40 to +85 °C
Storage Temperature	-40 to +85 °C
Input Power	+22 dBm (max) CW for 24 hours at +55˚C

Operation of this device outside the parameter ranges given above may cause permanent damage.

Temperature Drift Specification

Temperature Drift Equations:

$$\text{Temp Drift}_{high} = \left| \frac{\max(T_{ambient} - T_{hot}) - \min(T_{ambient} - T_{hot})}{2} \right|$$

$$\text{Temp Drift}_{low} = \left| \frac{\max(T_{ambient} - T_{cold}) - \min(T_{ambient} - T_{cold})}{2} \right|$$

Temperature Drift Terms Defined:

$T_{ambient}$ - Transmission power in dB measured at +25 degrees C.
T_{hot} - Transmission power in dB measured at +85 degrees C.
T_{cold} - Transmission power in dB measured at -40 degrees C.
Temperature Drift - Greater of Temp Drift_{high} vs Temp Drift_{low}
