## **IB IL CAN-MA-XC-PAC**

# Inline CAN master, extreme conditions version, for connecting a CAN bus system

## Data sheet

8355\_en\_01

© PHOENIX CONTACT 2015-06-29

## 1 Description

The terminal is designed for use within an Inline station.

It can be used to integrate a lower-level CAN bus system into the Inline station and thus in the bus system used.

Within the Inline station, the terminal acts as a CAN master for the lower-level CAN system.

Thanks to special engineering measures and tests, the terminal can be used under extreme ambient conditions.

#### **CAN** features

- CAN master
- Protocol: Transparent mode
- Transmission speed: 1 Mbps, maximum
- Smallest data type: 1 byte
- Diagnostic and error messages are exchanged via the status word

#### Local bus features

- Transmission speed of 500 kbps in local bus
- Maximum data width 2 x 64 bytes (= 128 bytes = 64 words);
   Data channel width: 126 bytes;
   Command/status word width: 2 bytes

#### **General features**

- Serial interface with plugged-in memory stick for saving configuration data
- DIP switch for setting the data width
- Diagnostic and status indicators
- Can be used under extreme ambient conditions
- Extended temperature range of -40°C ... +70°C (see "Tested successfully: use under extreme ambient conditions")
- Painted PCBs

This data sheet is only valid in association with the IL SYS INST UM E user manual.

Make sure you always use the latest documentation. It can be downloaded from the product at <u>phoenixcontact.net/products</u>.

No limitation of simultaneity, no derating

## 6 Tested successfully: Use under extreme ambient conditions

XC terminals have been tested successfully over 250 temperature change cycles in accordance with IEC 61131-2 in the range from -40°C to +70°C.

The following conditions were observed:

- The Inline devices for all connecting cables were connected with a minimum conductor cross section of 0.5 mm<sup>2</sup>
- The Inline station was assembled on a wall-mounted horizontal DIN rail
- Fans were used to ensure continuous movement of air in the control cabinet
- The Inline station was not exposed to vibration or shock
- The Inline station was operated with a maximum of 24.5 V (ensured by using regulated power supply units)

Figure 1 Temperature change cycle

Temperature in the control cabinet/ambient temperature

O

## WARNING:

Cycle

The terminal is not approved for use in potentially explosive areas.

The terminal is not approved for use in safety technology.

## 7 Internal circuit diagram

Figure 2 Internal wiring of the terminal points

## 8 Terminal point assignment

## NOTE: Malfunction with wrong connector

The connector supplied with the module has been designed for normal operation. In this connector, terminal points 1.3 and 2.3 are jumpered internally. Terminal point 1.3 is not connected with the associated contact pin of the device. This terminal point is only available to connect the ground cable of a second CAN cable.

You need an IB IL SCN-6 SHIELD shield plug for configuration. A bridge is not provided in this case, all terminal points are connected to the contact pins of the device. Use an external bridge between terminal points 1.3 and 2.3 to set the configuration mode.

i

These terminal points with the jumper from 1.3 and 2.3 are marked in blue on the connector supplied upon delivery.

Figure 3 Terminal point assignment

| 2.1            | CAN_L              | CAN low; connection of termination resistor  | blue                         |
| 2.2            | CAN_L              | CAN Low                                      | blue                         |
| 2.3            | GND <sub>BUS</sub> | CAN ground                                   | black                        |
| 1.4, 2.4       | Shield             | Shield connection                            | -                            |

#### Connector pin assignment: Connector for configuration

The connector for configuration is part of the configuration cable (see "ordering data").

If you assemble the configuration cable yourself, please use the IB IL SCN-6 SHIELD connector.

| Terminal point | Signal             | Assignment   | Color in<br>the CAN<br>cable |
|----------------|--------------------|--|------------------------------|
| 1.1            | CAN_H              | CAN high; connection of termination resistor                                 | White                        |
| 1.2            | CAN_H              | CAN High   | White                        |
| 1.3            | Mode               | Configuration mode,<br>when the bridge is<br>connected to GND <sub>BUS</sub> | black                        |
| 2.1            | CAN_L              | CAN low; connection of termination resistor                                  | blue                         |
| 2.2            | CAN_L              | CAN Low  | blue                         |
| 2.3            | GND <sub>BUS</sub> | CAN ground   | black                        |
| 1.4, 2.4       | Shield             | Shield connection  | -                            |

Insert a bridge between terminal points 1.3 and 2.3 of the IB IL SCN-6 SHIELD connector to switch to configuration mode. You may also use the configuration cable instead (see "ordering data").

## 9 Connection examples

Figure 5

CAN master in the center of a CAN bus when using the original connector

## 10 Connection notes

Observe the DR303-1 CANopen specification when installing the CAN bus.

| Figure 4 | CAN master within an Inline station |
|----------|-------------------------------------|
|----------|-------------------------------------|

Key:

| ILC    | Inline controller as head of the Inline station (could also be a bus coupler) |                  |
|--------|---|------------------|
| IL I/O | Inline terminals corresponding to your application                            |                  |
| CAN-MA | CAN master  | IB IL CAN-MA-PAC |
| CAN    | Connection to the low-level CAN bus   |                  |

# NOTE: malfunction when incorrectly wired

If you use a replacement item instead of the original connector, make sure that terminal point 1.3 cannot be used!

If you use the CAN master in the middle of the CAN bus, use the IB IL SCN 6-SHIELD-TWIN as replacement item.

Connect the GND of both CAN cables to terminal point 2.3 an.

For connection to a CAN cable, you can use IB IL SCN-6 SHIELD or IB IL SCN 6-SHIELD-TWIN as replacement item. Connect the GND of the CAN cables to termi-

nal point 2.3.

## 11 Local status and diagnostic indicators

#### 12 Setting the data width on the local bus with DIP switches 1 and 2

The expansion of the CAN system may vary. The maximum possible data width is set on the CAN master (default). The data width may be reduced to optimize the time response.

The data width is set with switches 1 and 2 of an 8-pos. DIP switch located on the left side of the housing.

The switch position is read after power up. The data width cannot be changed during operation.

i

Set the data width before you install the terminal since the switch can no longer be accessed when the terminal is installed.

Figure 8 DIP switch for setting the data width

Data width (in bytes) depending on the DIP switches:

| DIP switch (2,<br>1) | 00 | 01 | 10 | 11 (Default) |
|----------------------|----|----|----|--------------|
| PD SUPI A            | 32 | 64 | 64 | 64           |
| PD SUPI B            | 0  | 0  | 32 | 64           |
| PD total             | 32 | 64 | 96 | 128          |

Key:

| PD SUPI x | Process data width on microprocessor x  |
|-----------|---|
| SUPI      | Protocol chip   |
| PD total  | Total process data width (incl. 2 bytes each for the configuration and status word) |

DIP switches 8 to 3 are reserved and are not evaluated.

If you use the CAN master in a PROFIBUS station (e.g., with the IL PB BK DI8 DO4-PAC bus coupler or IL PB BK DI8 DO4/EF-PAC), please set a data width greater that 0 on the SUPI B.

If you disregard this information the "Less modules available than have been configured" error message will appear and you cannot operate the module.

#### 13 Interface with memory stick (Flash memory)

Figure 9 Interface with memory stick (1)

There is an interface with a plugged-in memory stick on the inclined part. Configuration data is stored on the memory stick.

When you replace a device you can transfer the configuration by inserting the memory stick into the new device.

## 14 Configuration

You only need to configure the Inline CAN master when you do not use the default setting. For default setting, see section "Possible parameters".

Configure the CAN master and the low-level CAN system as "local configuration" via the CAN interface.

Configuration data is stored on the memory stick.

# NOTE: no CAN communication in the event of invalid configuration data on the memory stick!

No CAN communication is possible if the memory stick is empty or not inserted, or if there is no valid configuration data on the memory stick.

Make sure that the memory stick is plugged in with a valid configuration.

A valid configuration is on the memory stick on delivery (default setting: see section "Possible parameters").

#### 14.1 Connection between Inline terminal and PC

Remove the original connector for configuration.

NOTE: malfunction with additional CAN device For configuration, there may only be a 1:1 connection between PC and CAN master. Make sure that no other CAN device is connected.

1

If you switch between configuration and normal operation, reset the voltage every time after you have changed the connector. The changed mode will only be detected after power up. The MD LED is flashing when the terminal is

in configuration mode.

For configuration, connect the PC to the CAN master. To do this, use the USB CAN adapter and the configuration cable (see "ordering data") or assemble a connecting cable with the IB IL SCN-6 SHIELD connector (see "Connector assignment for configuration").

Please make sure that the jumper between terminal points 1.3 and 2.3 is installed for configuration.

| IB IL CAN-MA CONF-<br>CAB<br>1.3 - 2.3 | D-SUB Inline configuration cable<br>(see Ordering Data)<br>Bridge |

#### 14.2 "IL CAN MA Configurator" configuration and download tool

The "IL CAN MA Configurator" is available as configuration and download tool for configuration and downloading the configuration onto the CAN master.

The tool can be downloaded free of charge online at phoenixcontact.net/products, under the item IB IL CAN-MA-PAC.

Install this tool, configure the terminal and therefore the CAN bus, and download the configuration to the memory stick.

#### NOTE: prevent accidental overwriting

When downloading the project after the configuration process, the configuration is transmitted immediately to the terminal/memory stick. You will not be requested whether you want to actually overwrite the previous project.

Save the old project before downloading it, if required.

i

An example of starting up the CAN bus can be found in the UM QS DE IB IL CAN-MA-PAC quick start guide.

#### 14.3 Possible parameters

You can configure the following parameters:

The values in bold show the default setting. When you use this configuration, you do not need to configure the Inline CAN master.

- Activate transparent mode (see also "Transparent Mode"; further modes can be selected later)
- Activate evaluation of the command word bits PI Exchange Stop

#### CAN Stop

- Transmission mode Unconfirmed transmission Confirmed transmission
- Baud rate in the CAN bus

#### 14.4 Connector pin assignment for configuration

If you do not use the pre-assembled configuration cable, assemble the cable for connecting the CAN master to the PC according to the interface assignment.

#### **IB IL SCN-6 SHIELD assignment**

See "Terminal point assignment, connector assignment: Connector for configuration".

#### **D-SUB connection assignment**

| D-SUB | Signal     | Assignment                                      | Color in the<br>CAN cable |  |  |  |  |
|-------|------------|---|---------------------------|--|--|--|--|

Figure 11 Connector pin assignment of the D-SUB socket and the Inline connector for the configuration cable

## **15** Transparent mode

The transparent mode allows direct access to Layer 2 of the ISO/OSI reference model. The user establishes communication within his application over a separate protocol. All outgoing and incoming CAN messages are transmitted with the help of a simple serial protocol within the process data channel. The higher customer-specific protocol actually takes place within the controller.

Protocol functions in the process data channel:

- Initializing the CAN controller
- Starting and stopping the CAN controller
- Transmitting a CAN message (with handshake mechanism)
- Configuring a filter for received messages (filtering over an identifier)
- Reporting the status of the CAN controller (e.g., Bus Off)

Access to layer 2 is supported via the handling components for PC Worx. Handling components for Step 7 are planned.

## 16 Transmission mode

You select the active transmission mode when you configure the CAN master.

- Unconfirmed transmission

With unconfirmed transmission, new data is transmitted with every bus cycle. A maximum data throughput is achieved with this mode. However, data may be lost without the transmitter or receiver noticing it. When using unconfirmed transmission, implement data integrity into a higher protocol layer (separately from the Inline CAN master).

- Confirmed transmission

The transmitter keeps transmitting the data until it receives a confirmation from the receiver. Advantage: secured data transmission. Disadvantage: low data throughput.

## 17 Input and output data

Key for the following sections:

| CAN message     | n data bytes + CAN-ID (2 bytes with<br>11-bit CAN message, 4 bytes with 4<br>bytes with 29 bits CAN message) |
|-----------------|--|
| CAN data packet | CAN message + message length<br>(LEN; 4 bits) + command code (CMD;<br>4 bits)                                |

Example of a CAN message and a CAN data packet with 11bit CAN message:

| Byte     | х      | <br>7    | 6      | 5           | 4   |  |  |
|----------|--------|----------|--------|-------------|-----|--|--|

| sage     | byte n | byte 0   |        |             |     |  |  |
| CAN data | Data   | <br>Data | RTR, C | RTR, CAN-ID |     |  |  |
| packet   | byte n | byte 0   |        |             | CMD |  |  |

- CAIN Short designation for the data direction lowerlevel CAN -> bus coupler/controller Data that the CAN master receives from the lower-level CAN bus and transmits to the bus coupler/controller (input data of the controller). A CAIN data record consists of the CAIN data of SUPI A and CAIN data of SUPI B. All data is valid and will be processed only when the data record is consistent.
- INCA Short designation for the data direction bus coupler/controller -> CAN

Data that the CAN master receives from the bus coupler/controller and sends to the lower-level CAN bus (output data of the controller).

An INCA data record consists of the INCA data of SUPIA and INCA data of the SUPI B. All data is valid and will be processed by the Inline CAN master only when the data record is consistent.

0

1

0

#### Byte 1, Bit 3: CC Bus Off

| 0 | CAN menter in pat in Rue Off |
|---|------------------------------|
| 0 | CAN master is not in Bus Off |

1 CAN master is in Bus Off (can be restarted by stopping and starting the CAN Stop bit in the command word. If the CAN Stop bit is not enabled, there will be an automatic restart of the CAN master with a Bus Off.)

#### Byte 1, Bit 2: CC Warn

- 0 CAN master is not in the error warning state
- 1 CAN master is in the error warning state

#### Byte 1, Bit 1: CC OVR

- 0 No CAN controller overrun
- 1 CAN controller overrun
  - (A CAN message was not received.)

#### Byte 1, Bit 0: CAIN OVR

0 No CAIN overrun

1 CAIN overrun

(Not all CAN messages received via CAN could be entered into the process data buffer of the bus coupler/controller (data throughput too low)).

#### Byte 0, Bit 1: CAN Stop

CAN controller is started (sending and receiving possible)

CAN controller is stopped, in Bus Off or in ERROR Passive State (at least no CAN communication or no transmission possible)

#### Byte 0, Bit 0: PI Ex Stop (PI Exchange Stop)

- CAN messages are sent and received
- 1 CAN messages are neither sent nor received

| Word  |                                    |                  |   |   |   |   |   | IN  | 11  |   |   |   |   |   |   |   |
|-------|------------------------------------|------------------|---|---|---|---|---|-----|---|---|---|---|---|---|---|---|
| Byte  | 3 2                                |                  |   |   |   |   |   |     |   |   |   |   |   |   |   |   |
| Bit   | 7                                  | 6                | 5 | 4 | 3 | 2 | 1 | 0   | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Assig |                                    | INCA Ack CAIN ID |   |   |   |   |   |     | Number of SUPI B CAN Number of SUPI A CAN |   |   |   |   |   |   |   |
| nmen  | (ID of last (Identification of the |                  |   |   |   |   |   | the | data packets data packets                 |   |   |   |   |   |   |   |
| t     | CAN data packet) CAN data packet)  |                  |   |   |   |   |   |     |   |   |   |   |   |   |   |   |

#### Byte 3, bit 7 ... 4: INCA Ack

For confirmed transmission, the ID of the CAN data packet received last will be returned to the transmitter as an acknowledgment. Only when the transmitter got the ID back will the next CAN data packet be sent.

#### Byte 3, bit 3 ... 0: CAIN ID

Every CAN data packet to be sent is to be given a consecutive count value for identification.

Value range: 0<sub>hex</sub> ... E<sub>hex</sub>

#### Byte 2, bit 7 ... 4: Number of SUPI B CAN data packets

Number of CAN data packets received from the lower-level CAN bus and to be transmitted to the bus coupler/controller in the process data channel of SUPI B.

#### Byte 2, bit 3 ... 0: number of SUPI A CAN data packets

Number of CAN data packets received from the lower-level CAN bus and to be transmitted to the bus coupler/controller in the process data channel of SUPI A.

#### 19.2 SUPI B input data (CAIN; lower-level CAN bus data direction-> bus/bus coupler)

#### Status word

| Word               |   | INO |   |   |   |   |   |   |   |   |                             |   |           |                               |   |   |
|--------------------|---|-----|---|---|---|---|---|---|---|---|-----------------------------|---|-----------|-------------------------------|---|---|

| Assig<br>nmen<br>t | 0 | 0   | 0 | 0 | 0 | 0 | 0 | 0 | С |   | A Ack<br>of last<br>a packe |   | lentifica | N ID<br>ition of t<br>a packe |   |   |

#### Byte 0, bit 7 ... 4: CAIN ID

Every CAN data packet to be sent is to be given a consecutive count value for identification.

Value range: 0<sub>hex</sub> ... E<sub>hex</sub>

#### Byte 0, bit 3 ... 0: INCA Ack

For confirmed transmission, the ID of the CAN data packet received last will be returned to the transmitter as an acknowledgment. Only when the transmitter got the ID back will the next CAN data packet be sent.

The values for CAIN Ack and INCA ID must match the values on SUPI A.

#### CAN data packet

Example: 11-bit CAN message and 8 byte data

| i | The first CAN data packet in SUPI A is shown.<br>A CAN data packet in SUPI B starts in the next<br>free byte (byte 1). |
|---|--|
|   | In the case of a CAN bus with 29-bit CAN message, 2 further bytes are required for the CAN ID.                         |

| Word  |                              | IN2 |   |        |       |   |  |   |  |  |     |   |   |    |    |    |
|-------|------------------------------|-----|---|--------|-------|---|--|---|--|--|-----|---|---|----|----|----|
| Byte  |                              |     |   | Ę      | 5     |   |  | 4 |  |  |     |   |   |    |    |    |
| Bit   | 7 6 5 4 3 2 1 0              |     |   |        |       |   |  |   |  | 6                                      | 5   | 4 | 3 | 2  | 1  | 0  |

## 20 Function block

There is a function block available which organizes the data exchange between the Inline CAN master and all CAN devices connected to it.

This function block can be downloaded at phoenixcontact.net/products.

For detailed information on how to use the function block, please refer to the quick start guide for the Inline CAN master.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;

- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);

- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;

- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком):

- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
