SPC584Bx

32-bit Power Architecture microcontroller for automotive ASIL-B applications

Datasheet - production data

Features

- · AEC-Q100 qualified
- High performance e200z420
 - 32-bit Power Architecture technology CPU
 - Core frequency as high as 120 MHz
 - Variable Length Encoding (VLE)
- 2112 KB (2048 KB code flash + 64 KB data flash) on-chip flash memory: supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
- 176 KB HSM dedicated flash memory (144 KB code + 32 KB data)
- 128 KB on-chip general-purpose SRAM (in addition to 64 KB core local data RAM
- Crossbar switch architecture for concurrent access to peripherals, Flash, or RAM from multiple bus masters with end-to-end ECC
- Multi-channel direct memory access controller (eDMA) with 64 channels
- 1 interrupt controller (INTC)
- Comprehensive new generation ASIL-B safety concept
 - ASIL-B of ISO 26262
 - FCCU for collection and reaction to failure notifications

- Memory Error Management Unit (MEMU) for collection and reporting of error events in memories
- Cyclic redundancy check (CRC) unit
- Enhanced low power support
 - Ultra low power STANDBY
 - Smart Wake-up Unit
 - Fast wake-up and execute from RAM
- Enhanced modular IO subsystem (eMIOS): up to 64 timed I/O channels with 16-bit counter resolution
- Body cross triggering unit (BCTU)
 - Triggers ADC conversions from any eMIOS channel
 - Triggers ADC conversions from up to 2 dedicated PIT RTIs
- Enhanced analog-to-digital converter system with:
 - 2 independent fast 12-bit SAR analog converters
 - 1 supervisor 12-bit SAR analog converter
 - 1 10-bit SAR analog converter with STDBY mode support
- · Communication interfaces
 - 1 Ethernet controller 10/100 Mbps, compliant IEEE 802.3-2008
 - 8 MCAN interfaces with advanced shared memory scheme and ISO CAN-FD support
 - 14 LINFlexD modules
 - 7 Deserial Serial Peripheral Interface (DSPI) modules
- Dual phase-locked loops with stable clock domain for peripherals and FM modulation domain for computational shell
- Nexus Development Interface (NDI) per IEEE-ISTO 5001-2003 standard, with some support for 2010 standard

- Boot Assist Flash (BAF) supports factory programming using a serial bootload through the asynchronous CAN or LIN/UART
- Junction temperature range -40 °C to 150 °C

Introduction SPC584Bx

1 Introduction

This document describes the features of the family and options available within the family members, and highlights important electrical and physical characteristics of the device. To ensure a complete understanding of the device functionality, refer also to the device reference manual and errata sheet.

SPC584Bx Description

2 Description

The SPC584Bx microcontroller is a member of the family of devices superseding the SPC560Bx family. SPC584Bx is built on the legacy of the SPC560Bx family, while introducing new features coupled with higher throughput to provide substantial reduction of cost per feature and significant power and performance improvement (MIPS per mW). On the SPC584Bx device, there is one processor core e200z420 and one e200z0 core embedded in the Hardware Security Module.

2.1 Device feature summary

Table 2 lists a summary of major features for the SPC584Bx device. The feature column represents a combination of module names and capabilities of certain modules. A detailed description of the functionality provided by each on-chip module is given later in this document.

Table 2. Features list

Feature	Description
SPC58 family	40 nm
Number of Cores	1
Local RAM	64 KB Data
Single Precision Floating Point	Yes
SIMD	No
VLE	Yes
Cache	8 KB Instruction
Cache	4 KB Data
MPU	Core MPU: 24 per CPU
WIFO	System MPU: 24 per XBAR
Semaphores	No
CRC Channels	2 x 4
Software Watchdog Timer (SWT)	2
Core Nexus Class	3+
Event Processor	4 x SCU
Event Flocessor	4 x PMC
Run control Module	Yes
System SRAM	128 KB (full standby RAM)
Flash	2048 KB code / 64 KB data
Flash fetch accelerator	2 x 4 x 256-bit
DMA channels	32
DMA Nexus Class	3

SPC584Bx Description

2.3 Features overview

On-chip modules within SPC584Bx include the following features:

- One main CPU, dual issue, 32-bit CPU core complexes (e200z4)
 - Power Architecture embedded specification compliance
 - Instruction set enhancement allowing variable length encoding (VLE), encoding a mix of 16-bit and 32-bit instructions, for code size footprint reduction
 - Single-precision floating point operations
 - 64 KB local data RAM for Core_2
 - 8 KB I-Cache and 4 KB D-Cache for Core_2
- 2112 KB (2048 KB code flash + 64 KB data flash) on-chip flash memory
 - Supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
- 176 KB HSM dedicated flash memory (144 KB code + 32 KB data)
- 128 KB on-chip general-purpose SRAM (+ 64 KB local data RAM: 64 KB included in the CPU)
- Multi channel direct memory access controllers
 - 32 eDMA channels
- One interrupt controller (INTC)
- Dual phase-locked loops with stable clock domain for peripherals and FM modulation domain for computational shell
- Crossbar switch architecture for concurrent access to peripherals, Flash, or RAM from multiple bus masters with end-to-end ECC
- Hardware security module (HSM) with HW cryptographic co-processor
- System integration unit lite (SIUL)
- Boot assist Flash (BAF) supports factory programming using a serial bootload through the asynchronous CAN or LIN/UART.
- Hardware support for safety ASIL-B level related applications
- Enhanced modular IO subsystem (eMIOS): up to 64 (2 x 32) timed I/O channels with 16-bit counter resolution
 - Buffered updates
 - Support for shifted PWM outputs to minimize occurrence of concurrent edges
 - Supports configurable trigger outputs for ADC conversion for synchronization to channel output waveforms
 - Shared or independent time bases
 - DMA transfer support available
 - Body Cross Triggering Unit (BCTU)
 - Triggers ADC conversions from any eMIOS channel
 - Triggers ADC conversions from up to 2 dedicated PIT RTIs
 - One event configuration register dedicated to each timer event allows to define the corresponding ADC channel
 - Synchronization with ADC to avoid collision
- Enhanced analog-to-digital converter system with:
 - Two independent fast 12-bit SAR analog converters

577

DS11701 Rev 4 11/142

Description SPC584Bx

- One supervisor 12-bit SAR analog converter
- One 10-bit SAR analog converter with STDBY mode support
- Seven Deserial Serial Peripheral Interface (DSPI) modules
- Fourteen LIN and UART communication interface (LINFlexD) modules
 - LINFlexD_0 is a Master/Slave
 - All others are Masters
- Eight modular controller area network (MCAN) modules, all supporting flexible data rate (ISO CAN-FD compliant)
- One ethernet controller 10/100 Mbps, compliant IEEE 802.3-2008
 - IEEE 1588-2008 Time stamping (internal 64-bit time stamp)
 - IEEE 802.1AS and IEEE 802.1Qav (AVB-Feature)
 - IEEE 802.1Q VLAN tag detection
 - IPv4 and IPv6 checksum modules
- Nexus development interface (NDI) per IEEE-ISTO 5001-2003 standard, with some support for 2010 standard
- Device and board test support per Joint Test Action Group (JTAG) (IEEE 1149.1 and IEEE 1149.7), 2-pin JTAG interface
- Standby power domain with smart wake-up sequence

3 Package pinouts and signal descriptions

Refer to the SPC584Bx IO_ Definition document.

It includes the following sections:

- 1. Package pinouts
- 2. Pin descriptions
 - a) Power supply and reference voltage pins
 - b) System pins
 - c) LVDS pins
 - d) Generic pins

DS11701 Rev 4 13/142

4 Electrical characteristics

4.1 Introduction

The present document contains the target Electrical Specification for the 40 nm family 32-bit MCU SPC584Bx products.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol "CC" (Controller Characteristics) is included in the "Symbol" column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol "SR" (System Requirement) is included in the "Symbol" column.

The electrical parameters shown in this document are guaranteed by various methods. To give the customer a better understanding, the classifications listed in *Table 3* are used and the parameters are tagged accordingly in the tables where appropriate.

Table 3. Parameter classifications

Classification tag	Tag description
Р	Those parameters are guaranteed during production testing on each individual device.
С	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
Т	Those parameters are achieved by design validation on a small sample size from typical devices.
D	Those parameters are derived mainly from simulations.

4.2 Absolute maximum ratings

Table 4 describes the maximum ratings for the device. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Stress beyond the listed maxima, even momentarily, may affect device reliability or cause permanent damage to the device.

Table 4. Absolute maximum ratings

Symbol				ute maximum rat			11.74	
		С	Parameter	Conditions	Min	Тур	Max	Unit
V _{DD_LV}	SR	D	Core voltage operating life range ⁽¹⁾	_	-0.3	_	1.4	V

T _{SDR}	SR	Т	Maximum solder temperature Pb- free packaged ⁽⁸⁾	_	_	_	260	°C	
MSL	SR	Т	Moisture sensitivity level ⁽⁹⁾	_	_	_	3		
T _{XRAY} dose	SR	Т	Maximum cumulated XRAY dose	Typical range for X-rays source during inspection:80 ÷ 130 KV; 20 ÷ 50 μA	_	_	1	grey	

- V_{DD_LV}: allowed 1.335 V 1.400 V for 60 seconds cumulative time at the given temperature profile. Remaining time allowed 1.260 V 1.335 V for 10 hours cumulative time at the given temperature profile. Remaining time as defined in Section 4.3: Operating conditions.
- 2. V_{DD_HV}: allowed 5.5 V 6.0 V for 60 seconds cumulative time at the given temperature profile, for 10 hours cumulative time with the device in reset at the given temperature profile. Remaining time as defined in Section 4.3: Operating conditions.
- 3. The maximum input voltage on an I/O pin tracks with the associated I/O supply maximum. For the injection current condition on a pin, the voltage will be equal to the supply plus the voltage drop across the internal ESD diode from I/O pin to supply. The diode voltage varies greatly across process and temperature, but a value of 0.3 V can be used for nominal calculations.
- 4. Relative value can be exceeded if design measures are taken to ensure injection current limitation (parameter IINJ).
- 5. This limitation applies to pads with digital input buffer enabled. If the digital input buffer is disabled, there are no maximum limits to the transition time.
- The limits for the sum of all normal and injected currents on all pads within the same supply segment can be found in Section 4.8.3: I/O pad current specifications.
- 175 °C are allowed for limited time. Mission profile with passive lifetime temperature >150 °C have to be evaluated by ST to confirm that are granted by product qualification.
- 8. Solder profile per IPC/JEDEC J-STD-020D.
- 9. Moisture sensitivity per JDEC test method A112.

4.3 Operating conditions

Table 5 describes the operating conditions for the device, and for which all the specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded or the functionality of the device is not guaranteed.

Table 5. Operating conditions

Table 5. Operating conditions (continued)

- 1. The ranges in this table are design targets and actual data may vary in the given range.
- Maximum operating frequency is applicable to the cores and platform of the device. See the Clock Chapter in the Microcontroller Reference Manual for more information on the clock limitations for the various IP blocks on the device.
- 3. In order to evaluate the actual difference between ambient and junction temperatures in the application, refer to Section 5.5: Package thermal characteristics.
- 4. Core voltage as measured on device pin to guarantee published silicon performance.
- Core voltage can exceed 1.26 V with the limitations provided in Section 4.2: Absolute maximum ratings, provided that HVD134_C monitor reset is disabled.
- 1.260 V 1.290 V range allowed periodically for supply with sinusoidal shape and average supply value below or equal to 1.236 V at the given temperature profile.
- 7. Full device lifetime. I/O and analog input specifications are only valid if the injection current on adjacent pins is within these limits. See Section 4.2: Absolute maximum ratings for maximum input current for reliability requirements.
- 8. The I/O pins on the device are clamped to the I/O supply rails for ESD protection. When the voltage of the input pins is above the supply rail, current will be injected through the clamp diode to the supply rails. For external RC network calculation, assume typical 0.3 V drop across the active diode. The diode voltage drop varies with temperature.
- 9. The limits for the sum of all normal and injected currents on all pads within the same supply segment can be found in Section 4.8.3: I/O pad current specifications.
- 10. Positive and negative Dynamic current injection pulses are allowed up to this limit. I/O and ADC specifications are not granted. See the dedicated chapters for the different specification limits. See the Absolute Maximum Ratings table for maximum input current for reliability requirements. Refer to the following pulses definitions: Pulse1 (ISO 7637-2:2011), Pulse 2a(ISO 7637-2:2011 5.6.2), Pulse 3a (ISO 7637-2:2011 5.6.3).

4.3.1 Power domains and power up/down sequencing

The following table shows the constraints and relationships for the different power domains. Supply1 (on rows) can exceed Supply2 (on columns), only if the cell at the given row and column is reporting 'ok'. This limitation is valid during power-up and power-down phases, as well as during normal device operation.

Table 6. Device supply relation during power-up/power-down sequence

			Supply2						
		V _{DD_LV}	V _{DD_HV_IO_ETH}	V _{DD_HV_IO_MAIN} V _{DD_HV_FLA} V _{DD_HV_OSC}	V _{DD_HV_ADV}	V _{DD_HV_ADR}			
	V _{DD_HV_IO_ETH}	ok		not allowed	ok	ok			
Supply1	V _{DD_HV_IO_MAIN} Vdd_hv_fla Vdd_hv_osc	ok	ok		ok	ok			
Sup	V _{DD_HV_ADV}	ok	ok	not allowed		ok			
	$V_{DD_HV_ADR}$	ok	ok	not allowed	not allowed				

During power-up, all functional terminals are maintained in a known state as described in the device pinout Microsoft Excel file attached to the IO_Definition document.

4.4 Electrostatic discharge (ESD)

The following table describes the ESD ratings of the device:

 All ESD testing are in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

• Device failure is defined as: "If after exposure to ESD pulses, the device does not meet the device specification requirements, which include the complete DC parametric and functional testing at room temperature and hot temperature, maximum DC parametric variation within 10 % of maximum specification".

Table 7. ESD ratings

Parameter	С	Conditions	Value	Unit
ESD for Human Body Model (HBM) ⁽¹⁾	Т	All pins	2000	V
ESD for field induced Charged Device Model (CDM) ⁽²⁾	Т	All pins	500	V
ESD for field iffduced Charged Device Model (CDM)	Т	Corner pins	750	V

^{1.} This parameter tested in conformity with ANSI/ESD STM5.1-2007 Electrostatic Discharge Sensitivity Testing.

577

^{2.} This parameter tested in conformity with ANSI/ESD STM5.3-1990 Charged Device Model - Component Level.

4.5 Electromagnetic compatibility characteristics

EMC measurements at IC-level IEC standards are available from STMicroelectronics on request.

DS11701 Rev 4 21/142

4.6 Temperature profile

The device is qualified in accordance to AEC-Q100 Grade1 requirements, such as HTOL 1,000 h and HTDR 1,000 hrs, T_J = 150 °C.

- 1. The ranges in this table are design targets and actual data may vary in the given range.
- The leakage considered is the sum of core logic and RAM memories. The contribution of analog modules is not considered, and they are computed in the dynamic I_{DD LV} and I_{DD HV} parameters.
- 3. I_{DD_LKG} (leakage current) and I_{DD_LV} (dynamic current) are reported as separate parameters, to give an indication of the consumption contributors. The tests used in validation, characterization and production are verifying that the total consumption (leakage+dynamic) is lower or equal to the sum of the maximum values provided (I_{DD_LKG} + I_{DD_LV}). The two parameters, measured separately, may exceed the maximum reported for each, depending on the operative conditions and the software profile used.
- 4. Use case: 1 x e200Z4 @120 MHz, HSM @60 MHz, all IPs clock enabled, Flash access with prefetch disabled, Flash consumption includes parallel read and program/erase, all SARADC in continuous conversion, DMA continuously triggered by ADC conversion, 2 DSPI / 8 CAN / 2 LINFlex transmitting, RTC and STM running, 1 x EMIOS running (4 channels in OPWMT mode), FIRC, SIRC, FXOSC, PLL0-1 running. The switching activity estimated for dynamic consumption does not include I/O toggling, which is highly dependent on the application. Details of the software configuration are available separately. The total device consumption is I_{DD_LV} + I_{DD_HV} + I_{DD_LKG} for the selected temperature.
- 5. Gateway use case: One core running at 120 MHz, HSM 40 MHz, DMA, PLL, FLASH read only 25%, 8xCAN, 1xSARADC.
- 6. BCM use case: One Core running at 80 MHz, HSM 40 MHz, DMA, PLL, FLASH read only 25%, 1xCAN, 3xSARADC.
- Dynamic consumption of the HSM module, including the dedicated memories, during the execution of Electronic Code Book crypto algorithm on 1 block of 16 byte of shared RAM.
- Flash in Low Power. Sysclk at 120 MHz, HSM 60 MHz, PLL0_PHI at 400 MHz, XTAL at 40 MHz, FIRC 16 MHz ON, RCOSC1M off. FlexCAN: instances: 0, 1, 2, 3, 4, 5, 6, 7 ON (configured but no reception or transmission), Ethernet ON (configured but no reception or transmission), ADC ON (continuously converting). All others IPs clock-gated.
- Sysclk = RC16 MHz, RC16 MHz ON, RC1 MHz ON, PLL OFF. All possible peripherals off and clock gated. Flash in power down mode.
- 10. STANDBY mode: device configured for minimum consumption, RC16 MHz off, RC1 MHz on.

- 11. SSWU1 mode adder: FIRC = ON, SSWU clocked at 8 MHz and running over all STANDBY period, ADC off. The total standby consumption can be obtained by adding this parameter to the IDDSTBY parameter for the selected memory size and temperature.
- 12. SSWU2 mode adder: FIRC = ON, SSWU clocked at 8 MHz and running over all STANDBY period, ADC on in continuous conversion. The total standby consumption can be obtained by adding this parameter to the IDDSTBY parameter for the selected memory size and temperature.

DS11701 Rev 4 25/142

4.8 I/O pad specification

The following table describes the different pad type configurations.

Table 9. I/O pad specification descriptions

Pad type	Description
Weak configuration	Provides a good compromise between transition time and low electromagnetic emission.
Medium configuration	Provides transition fast enough for the serial communication channels with controlled current to reduce electromagnetic emission.
Strong configuration	Provides fast transition speed; used for fast interface.
Very strong configuration	Provides maximum speed and controlled symmetric behavior for rise and fall transition. Used for fast interface including Ethernet interface requiring fine control of rising/falling edge jitter.
Differential configuration	A few pads provide differential capability providing very fast interface together with good EMC performances.
Input only pads	These low input leakage pads are associated with the ADC channels.
Standby pads	These pads (LP pads) are active during STANDBY. They are configured in CMOS level logic and this configuration cannot be changed. Moreover, when the device enters the STANDBY mode, the pad-keeper feature is activated for LP pads. It means that: – if the pad voltage level is above the pad keeper high threshold, a weak pull-up resistor is automatically enabled – if the pad voltage level is below the pad keeper low threshold, a weak pull-down resistor is automatically enabled.
	For the pad-keeper high/low thresholds, consider(VDD_HV_IO_MAIN / 2) +/-20 %.

Note:

Each I/O pin on the device supports specific drive configurations. See the signal description table in the device reference manual for the available drive configurations for each I/O pin. PMC_DIG_VSIO register has to be configured to select the voltage level (3.3 V or 5.0 V) for each IO segment.

Logic level is configurable in running mode while it is CMOS not-configurable in STANDBY for LP (low power) pads, so if a LP pad is used to wakeup from STANDBY, it should be configured as CMOS also in running mode in order to prevent device wrong behavior in STANDBY.

4.8.1 I/O input DC characteristics

The following table provides input DC electrical characteristics, as described in Figure 3.

Figure 3. I/O input electrical characteristics

Table 10. I/O input electrical characteristics

R _{WPU}	СС	D	Weak Pull-up resistance	V _{DD_HV_IO} = 3.3 V ± 10%	19	_	62	ΚΩ
	00	Т	Weak pull-	V _{IN} = 0.69 * V _{DD_HV_IO} ⁽¹⁾	_	_	130	
I _{WPD}	CC	Р	down current absolute value	$V_{IN} = 0.9 V^{(2)}$	15	_	_	μΑ
R _{WPD}	СС	D	Weak Pull- down resistance	V _{DD_HV_IO} = 5.0 V ± 10%	29	_	60	ΚΩ
R _{WPD}	СС	D	Weak Pull- down resistance	V _{DD_HV_IO} = 3.3 V ± 10%	19	_	60	ΚΩ

^{1.} Maximum current when forcing a change in the pin level opposite to the pull configuration.

Note:

When the device enters into standby mode, the LP pads have the input buffer switched-on. As a consequence, if the pad input voltage VIN is $V_{SS} < V_{IN} < V_{DD_HV}$, an additional consumption can be measured in the VDD_HV domain. The highest consumption can be seen around mid-range (VIN ~=VDD_HV/2), 2-3 mA depending on process, voltage and temperature.

^{2.} Minimum current when keeping the same pin level state than the pull configuration.

This situation may occur if the PAD is used as a ADC input channel, and $V_{SS} < V_{IN} < V_{DD_HV}$. The applications should ensure that LP pads are always set to VDD_HV or VSS, to avoid the extra consumption. Refer to the device pinout IO definition excel file to identify the low-power pads which also have an ADC function.

4.8.2 I/O output DC characteristics

Figure 4 provides description of output DC electrical characteristics.

Figure 4. I/O output DC electrical characteristics definition

The following tables provide DC characteristics for bidirectional pads:

- Table 12 provides output driver characteristics for I/O pads when in WEAK/SLOW configuration.
- Table 13 provides output driver characteristics for I/O pads when in MEDIUM configuration.
- Table 14 provides output driver characteristics for I/O pads when in STRONG/FAST configuration.
- *Table 15* provides output driver characteristics for I/O pads when in VERY STRONG/VERY FAST configuration.

Note: 10 %/90 % is the default condition for any parameter if not explicitly mentioned differently.

4.8.3 I/O pad current specifications

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a V_{DD}/V_{SS} supply pair as described in the device pinout Microsoft Excel file attached to the IO_Definition document.

Table 16 provides I/O consumption figures.

In order to ensure device reliability, the average current of the I/O on a single segment should remain below the I_{RMSSEG} maximum value.

In order to ensure device functionality, the sum of the dynamic and static current of the I/O on a single segment should remain below the I_{DYNSEG} maximum value.

Pad mapping on each segment can be optimized using the pad usage information provided on the I/O Signal Description table.

Table 16. I/O consumption

^{1.} I/O current consumption specifications for the 4.5 V \leq V_{DD_HV_IO} \leq 5.5 V range are valid for VSIO_[VSIO_xx] = 1, and VSIO[VSIO_xx] = 0 for 3.0 V \leq V_{DD_HV_IO} \leq 3.6 V.

^{2.} Average consumption in one pad toggling cycle.

^{3.} Stated maximum values represent peak consumption that lasts only a few ns during I/O transition. When possible (timed output) it is recommended to delay transition between pads by few cycles to reduce noise and consumption.

4.9 Reset pad (PORST) electrical characteristics

The device implements dedicated bidirectional reset pins as below specified. $\overline{\text{PORST}}$ pin does not require active control. It is possible to implement an external pull-up to ensure correct reset exit sequence. Recommended value is 4.7 K Ω .

Figure 5. Startup reset requirements

Figure 6 describes device behavior depending on supply signal on PORST:

- 1. PORST low pulse has too low amplitude: it is filtered by input buffer hysteresis. Device remains in current state.
- 2. PORST low pulse has too short duration: it is filtered by low pass filter. Device remains in current state.
- 3. PORST low pulse is generating a reset:
 - a) PORST low but initially filtered during at least WFRST. Device remains initially in current state.
 - b) PORST potentially filtered until WNFRST. Device state is unknown. It may either be reset or remains in current state depending on extra condition (temperature, voltage, device).
 - c) PORST asserted for longer than WNFRST. Device is under reset.

Figure 6. Noise filtering on reset signal

I_{ol r} applies to PORST: Strong Pull-down is active on PHASE0 for PORST. Refer to the device pinout IO definition excel file for details regarding pin usage.

Table 18. Reset PAD state during power-up and reset

PAD	POWER-UP State	RESET state	DEFAULT state ⁽¹⁾	STANDBY state
PORST	Strong pull-down	Weak pull-down	Weak pull-down	Weak pull-up

Before SW Configuration. Refer to the Device Reference Manual, Reset Generation Module (MC_RGM) Functional Description chapter for the details of the power-up phases.

^{2.} Maximum current when forcing a change in the pin level opposite to the pull configuration.

^{3.} Minimum current when keeping the same pin level state than the pull configuration.

4.10 PLLs

Two phase-locked loop (PLL) modules are implemented to generate system and auxiliary clocks on the device.

Figure 7 depicts the integration of the two PLLs. Refer to device Reference Manual for more detailed schematic.

Figure 7. PLLs integration

I _{XTAL}	СС	D	XTAL current ^{(8),(9)}	T _J = -40 °C to 150 °C	_	14	mA	

Table 21. External 40 MHz oscillator electrical specifications (continued)

- 1. The range is selectable by UTEST miscellaneous DCF client XOSC_FREQ_SEL.
- The XTAL frequency, if used to feed the PPL0 (or PLL1), shall obey the minimum input frequency limit set for PLL0 (or PLL1).
- 3. This value is determined by the crystal manufacturer and board design, and it can potentially be higher than the maximum provided.
- 4. Proper PC board layout procedures must be followed to achieve specifications.
- Crystal recovery time is the time for the oscillator to settle to the correct frequency after adjustment of the integrated load capacitor value.
- 6. Applies to an external clock input and not to crystal mode.
- 7. See crystal manufacturer's specification for recommended load capacitor (C_L) values. The external oscillator requires external load capacitors when operating from 8 MHz to 16 MHz. Account for on-chip stray capacitance (C_{S EXTAL}/C_{S XTAL}) and PCB capacitance when selecting a load capacitor value. When operating at 20 MHz/40 MHz, the integrated load capacitor value is selected via S/W to match the crystal manufacturer's specification, while accounting for on-chip and PCB capacitance.
- 8. Amplitude on the EXTAL pin after startup is determined by the ALC block, that is the Automatic Level Control Circuit. The function of the ALC is to provide high drive current during oscillator startup, but reduce current after oscillation in order to reduce power, distortion, and RFI, and to avoid over driving the crystal. The operating point of the ALC is dependent on the crystal value and loading conditions.
- I_{XTAL} is the oscillator bias current out of the XTAL pin with both EXTAL and XTAL pins grounded. This is the maximum current during startup of the oscillator.

4.12.2 SAR ADC 12 bit electrical specification

The SARn ADCs are 12-bit Successive Approximation Register analog-to-digital converters with full capacitive DAC. The SARn architecture allows input channel multiplexing.

Note:

The functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maximum may affect device reliability or cause permanent damage to the device.

Minimum ADC sample times are dependent on adequate charge transfer from the external driving circuit to the internal sample capacitor. The time constant of the entire circuit must allow the sampling capacitor to charge within 1/2 LSB within the sampling window. Refer to *Figure 8* for models of the internal ADC circuit, and the values to use in external RC sizing and calculating the sampling window duration.

- 2. Mode1: 6 sampling cycles + 10 conversion cycles at 13.33 MHz.
- 3. Mode2: 5 sampling cycles + 10 conversion cycles at 13.33 MHz.
- 4. Mode3: 6 sampling cycles + 10 conversion cycles at 16 MHz.
- I_{ADCREFH} and I_{ADCREFL} are independent from ADC clock frequency. It depends on conversion rate: consumption is driven by the transfer of charge between internal capacitances during the conversion.
- 6. Current parameter values are for a single ADC.

DS11701 Rev 4

- 7. TUE is granted with injection current within the range defined in Table 25, for parameters classified as T and D.
- 8. DNL is granted with injection current within the range defined in *Table 25*, for parameters classified as T and D.

4.12.3 SAR ADC 10 bit electrical specification

The ADC comparators are 10-bit Successive Approximation Register analog-to-digital converters with full capacitive DAC. The SARn architecture allows input channel multiplexing.

Note:

The functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maximum may affect device reliability or cause permanent damage to the device.

I _{PIN_RX}	СС	D	Maximum consumption on receiver input pin	Δ_{VI} = 400 mV, R _{IN} = 80 Ω	_	_	5	mA

- The LVDS pad startup and receiver electrical characteristics in this table apply to both the LFAST & High-speed Debug (HSD) LVDS pad.
- 2. All LVDS pad electrical characteristics are valid from -40 °C to 150 °C.
- 3. All startup times are defined after a 2 peripheral bridge clock delay from writing to the corresponding enable bit in the LVDS control registers (LCR) of the LFAST and High-speed Debug modules. The value of the LCR bits for the LFAST/HSD modules don't take effect until the corresponding SIUL2 MSCR ODC bits are set to LFAST LVDS mode. Startup times for MSC/DSPI LVDS are defined after 2 peripheral bridge clock delay after selecting MSC/DSPI LVDS in the corresponding SIUL2 MSCR ODC field.
- 4. Startup times are valid for the maximum external loads CL defined in both the LFAST/HSD and MSC/DSPI transmitter electrical characteristic tables.
- Bias startup time is defined as the time taken by the current reference block to reach the settling bias current after being enabled.
- Total transmitter startup time from power down to normal mode is t_{STRT_BIAS} + t_{PD2NM_TX} + 2 peripheral bridge clock periods
- Total transmitter startup time from sleep mode to normal mode is t_{SM2NM_TX} + 2 peripheral bridge clock periods. Bias block remains enabled in sleep mode.

DS11701 Rev 4 59/142

- 8. Total receiver startup time from power down to normal mode is $t_{STRT_BIAS} + t_{PD2NM_RX} + 2$ peripheral bridge clock periods.
- Total receiver startup time from power down to sleep mode is t_{PD2SM_RX} + 2 peripheral bridge clock periods. Bias block remains enabled in sleep mode.
- 10. Absolute min = 0.15 V (285 mV/2) = 0 V
- 11. Absolute max = 1.6 V + (285 mV/2) = 1.743 V
- 12. Value valid for LFAST mode. The LXRXOP[0] bit in the LFAST LVDS Control Register (LCR) must be set to one to ensure proper LFAST receive timing.
- 13. Total internal capacitance including receiver and termination, co-bonded GPIO pads, and package contributions.

Table 30. LFAST transmitter electrical characteristics (1),(2),(3)

^{1.} This table is applicable to LFAST LVDS pads used in LFAST configuration (SIUL2_MSCR_IO_n.ODC=101).

The LFAST and High-Speed Debug LFAST pad electrical characteristics are based on worst case internal capacitance values shown in Figure 12.

^{3.} All LFAST and High-Speed Debug LVDS pad electrical characteristics are valid from -40 °C to 150 °C.

Valid for maximum data rate f_{DATA}. Value given is the capacitance on each terminal of the differential pair, as shown in Figure 12.

^{5.} Valid for maximum external load C₁.

Figure 12. LVDS pad external load diagram

4.14.3 LFAST PLL electrical characteristics

The following table contains the electrical characteristics for the LFAST PLL.

Value С **Symbol Conditions** Unit **Parameter** Min Max Тур 10⁽²⁾ PLL reference clock frequency (CLKIN) SR D 30 MHz f_{RF REF} CC D PLL reference clock frequency error -1 1 % $\mathsf{ERR}_\mathsf{REF}$ CC D PLL reference clock duty cycle (CLKIN) 30 70 % DC_{REF} Integrated phase noise D PΝ CC $f_{RF_REF} = 20 \text{ MHz}$ -58 dBc (single side band) $320^{(3)}$ CC Р PLL VCO frequency 312 MHz f_{VCO} 150⁽⁴⁾ CC D PLL phase lock μs **t**LOCK

Table 31. LFAST PLL electrical characteristics⁽¹⁾

Table 31. LFAST PLL electrical characteristics⁽¹⁾ (continued)

Symbol		С	Parameter	Conditions		Unit		
		C		Conditions	Min	Тур	Max	Oiiit
ΔPER _{REF}	SR -	Т	Input reference clock jitter (peak to peak)	Single period, f _{RF_REF} = 20 MHz	_	_	350	ps
	SIX	Т	imput reference clock filter (peak to peak)	Long term, f _{RF_REF} = 20 MHz	-500	_	500	ps
ΔPER _{EYE}	СС	Т	Output Eye Jitter (peak to peak) ⁽⁵⁾	_	_	_	400	ps

- 1. The specifications in this table apply to both the interprocessor bus and debug LFAST interfaces.
- 2. If the input frequency is lower than 20 MHz, it is required to set a input division factor of 1.
- 3. The 320 MHz frequency is achieved with a 20 MHz reference clock.
- 4. The total lock time is the sum of the coarse lock time plus the programmable lock delay time 2 clock cycles of the peripheral bridge clock that is connected to the PLL on the device (to set the PLL enable bit).
- 5. Measured at the transmitter output across a 100 Ω termination resistor on a device evaluation board. See *Figure 12*.

4.15 Power management

The power management module monitors the different power supplies as well as it generates the required internal supplies. The device can operate in the following configurations:

				.90	a.a.o.o		
Device	External regulator	Internal SMPS regulator	Internal linear regulator external ballast	Internal linear regulator internal ballast	Auxiliary regulator	Clamp regulator	Internal standby regulator ⁽¹⁾
SPC584Bx	_	_	X ⁽²⁾	Х	Х	X	Х

Table 32. Power management regulators

4.15.1 Power management integration

Use the integration schemes provided below to ensure the proper device function, according to the selected regulator configuration.

The internal regulators are supplied by $V_{DD_HV_IO_MAIN}$ supply and are used to generate V_{DD_LV} supply.

Place capacitances on the board as near as possible to the associated pins and limit the serial inductance of the board to less than 5 nH.

It is recommended to use the internal regulators only to supply the device itself.

^{1.} Standby regulator is automatically activated when the device enters standby mode.

^{2.} For compatibility purpose with SPC584Cx/SPC58ECx, or for the optimization of the power dissipation, the operability of the device with external ballast can be used. The external ballast option is available only on specific devices, contact the local sales

- 1. V_{DD} = 3.3 V ± 10 % / 5.0 V ± 10 %, T_{J} = -40 / 150 °C, unless otherwise specified.
- 2. Recommended X7R or X5R ceramic -50 % / +35 % variation across process, temperature, voltage and after aging.
- 3. CE capacitance is required both in internal and external regulator mode.
- 4. For noise filtering, add a high frequency bypass capacitance of 10 nF.
- 5. For applications it is recommended to implement at least 5 $\ensuremath{\text{C}_{\text{LV}}}$ capacitances.
- 6. Recommended X7R capacitors. For noise filtering, add a high frequency bypass capacitance of 100 nF.
- 7. CB capacitance is required if only the external ballast is implemented.

4.15.2 Voltage regulators

Table 34. Linear regulator specifications

^{1.} Even if LVD/HVD monitor reaction is configurable, the application ensures that the device remains in the operative condition range, and the internal LVDx monitors are disabled by the application. Then an external voltage monitor with minimum threshold of VDD_LV(min) = 1.08 V measured at the device pad, has to be implemented. For HVDx, if the application disables them, then they need to grant that VDD_LV and VDD_HV voltage levels stay withing the limitations provided in Section 4.2: Absolute maximum ratings.

^{2.} The values reported are Trimmed values, where applicable.

See Figure 17. Transitions shorter than minimum are filtered. Transitions longer than maximum are not filtered, and will be delayed by T_{VMFILTER} time. Transitions between minimum and maximum can be filtered or not filtered, according to temperature, process and voltage variations.

4.16 Flash

The following table shows the Wait state configuration.

Table 39. Wait state configuration

Table 40. Flash memory program and erase specifications (continued)

1. Characteristics are valid both for Data Flash and Code Flash, unless specified in the characteristics column.

4.0

- 2. Actual hardware operation times; this does not include software overhead.
- 3. Typical program and erase times assume nominal supply values and operation at 25 °C.
- 4. Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations. These values are characteristic, but not tested.

Τ

- 5. Lifetime maximum program & erase times apply across the voltages and temperatures and occur after the specified number of program/erase cycles. These maximum values are characterized but not tested or guaranteed.
- Initial factory condition: < 100 program/erase cycles, 25 °C typical junction temperature and nominal (± 5 %) supply voltages.
- Initial maximum "All temp" program and erase times provide guidance for time-out limits used in the factory and apply for less than or equal to 100 program or erase cycles, -40 °C < TJ < 150 °C junction temperature and nominal (± 5 %) supply voltages.
- 8. Rate computed based on 256 KB sectors.

sequential)(12)

- 9. Only code sectors, not including EEPROM.
- 10. Time between suspend resume and next suspend. Value stated actually represents Min value specification.
- 11. Timings guaranteed by design.
- 12. AIC is done using system clock, thus all timing is dependent on system frequency and number of wait states. Timing in the table is calculated at max frequency.

t_{MR256KS}

DS11701 Rev 4 75/142

All the Flash operations require the presence of the system clock for internal synchronization. About 50 synchronization cycles are needed: this means that the timings of the previous table can be longer if a low frequency system clock is used.

16	_	СС	D	TDO hold time with respect to TCK falling edge (minimum TDO propagation delay)	2.25	_	ns

Nexus timing specified at V_{DD_HV_IO_JTAG} = 3.0 V to 5.5 V, and maximum loading per pad type as specified in the I/O section of the data sheet.

^{2.} t_{CYC} is system clock period.

^{3.} Achieving the absolute minimum TCK cycle time may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual peripheral frequency being used. To ensure proper operation TCK frequency should be set to the peripheral frequency divided by a number greater than or equal to that specified here.

^{4.} This is a functionally allowable feature. However, it may be limited by the maximum frequency specified by the Absolute minimum TCK period specification.

^{5.} This value is TDO propagation time 36 ns + 4 ns setup time to sampling edge.

^{6.} This may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual system frequency being used.

^{7.} This value is TDO propagation time 16 ns + 4 ns setup time to sampling edge.

^{8.} Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.

Each DSPI module can be configured to use different pins for the interface. Refer to the device pinout Microsoft Excel file
attached to the IO_Definition document for the available combinations. It is not possible to reach the maximum
performance with every possible combination of pins.

- 2. Maximum usable frequency can be achieved if used with fastest configuration of the highest drive pads.
- 3. Maximum usable frequency does not take into account external device propagation delay.

4.17.2.1 DSPI master mode full duplex timing with CMOS pads

4.17.2.1.1 DSPI CMOS master mode – classic timing

Note:

In the following table, all output timing is worst case and includes the mismatching of rise and fall times of the output pads.

Table 46. DSPI CMOS master classic timing (full duplex and output only)

MTFE = 0, CPHA = 0 or 1

- 1. All timing values for output signals in this table are measured to 50 % of the output voltage.
- 2. Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.
- 3. N is the number of clock cycles added to time between PCS assertion and SCK assertion and is software programmable using DSPI_CTARx[PSSCK] and DSPI_CTARx[CSSCK]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, N is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI_CLKn).
- 4. t_{SYS} is the period of DSPI_CLKn clock, the input clock to the DSPI module. Maximum frequency is 100 MHz (min t_{SYS} = 10 ns).
- 5. M is the number of clock cycles added to time between SCK negation and PCS negation and is software programmable using DSPI_CTARx[PASC] and DSPI_CTARx[ASC]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, M is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI_CLKn).
- 6. t_{SDC} is only valid for even divide ratios. For odd divide ratios the fundamental duty cycle is not 50:50. For these odd divide ratios cases, the absolute spec number is applied as jitter/uncertainty to the nominal high time and low time.
- 7. PCSx and PCSS using same pad configuration.
- 8. Input timing assumes an input slew rate of 1 ns (10 % 90 %) and uses TTL voltage thresholds.
- SOUT Data valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

Figure 33. DSPI slave mode — modified transfer format timing (MFTE = 0/1) CPHA = 0

4.17.3 Ethernet timing

The Ethernet provides both MII and RMII interfaces. The MII and RMII signals can be configured for either CMOS or TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V. Check the device pinout details to review the packages supporting MII and RMII.

4.17.3.1 MII receive signal timing (RXD[3:0], RX_DV, RX_ER, and RX_CLK)

The receiver functions correctly up to a RX CLK maximum frequency of 25 MHz +1 %. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX CLK frequency.

Note:

In the following table, all timing specifications are referenced from RX CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

Symbol	Symbol		Characteristic	Va	lue	Unit	
Symbol		С	Characteristic	Min	Max	Oill	
M1	СС	D	RXD[3:0], RX_DV, RX_ER to RX_CLK setup	5	_	ns	
M2	СС	D	RX_CLK to RXD[3:0], RX_DV, RX_ER hold	5	_	ns	
M3	СС	D	RX_CLK pulse width high	35 %	65 %	RX_CLK period	
M4	СС	D	RX_CLK pulse width low	35 %	65 %	RX_CLK period	

Table 49. MII receive signal timing

M3 RX_CLK (input) M4 RXD[3:0] (inputs) RX DV RX ER M1 M2

Figure 35. MII receive signal timing diagram

4.17.3.2 MII transmit signal timing (TXD[3:0], TX_EN, TX_ER, TX_CLK)

The transmitter functions correctly up to a TX CLK maximum frequency of 25 MHz +1 %. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX_CLK frequency.

The transmit outputs (TXD[3:0], TX EN, TX ER) can be programmed to transition from either the rising or falling edge of TX CLK, and the timing is the same in either case. This option allows the use of non-compliant MII PHYs.

Refer to the SPC584Bx 32-bit Power Architecture microcontroller reference manual's Ethernet chapter for details of this option and how to enable it.

Note:

In the following table, all timing specifications are referenced from TX_CLK = 1.4 V to the valid output levels, 0.8 V and 2.0 V.

Symbol		С	Characteristic	Value ⁽¹⁾		- Unit	
Symbol			Gilalacteristic	Min	Max	Ome	
M5	CC	D	TX_CLK to TXD[3:0], TX_EN, TX_ER invalid	5	_	ns	
M6	СС	D	TX_CLK to TXD[3:0], TX_EN, TX_ER valid	_	25	ns	
M7	СС	D	TX_CLK pulse width high	35 %	65 %	TX_CLK period	
M8	CC	D	TX_CLK pulse width low	35 %	65 %	TX_CLK period	

Table 50. MII transmit signal timing

Output parameters are valid for C_L = 25 pF, where C_L is the external load to the device. The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value

Figure 36. MII transmit signal timing diagram

Figure 39. MII serial management channel timing diagram

4.17.3.6 RMII receive signal timing (RXD[1:0], CRS_DV)

The receiver functions correctly up to a REF CLK maximum frequency of 50 MHz +1 %. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX CLK frequency, which is half that of the REF CLK frequency.

Note:

In the following table, all timing specifications are referenced from REF_CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

Symbol		С	Characteristic	Va	lue	Unit	
Syllibol		C	Gilaracteristic	Min	Max	Jiiit

Table 54. RMII receive signal timing

Figure 40. RMII receive signal timing diagram

4.17.3.7 RMII transmit signal timing (TXD[1:0], TX_EN)

The transmitter functions correctly up to a REF_CLK maximum frequency of 50 MHz + 1 %. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX_CLK frequency, which is half that of the REF_CLK frequency.

The transmit outputs (TXD[1:0], TX_EN) can be programmed to transition from either the rising or falling edge of REF_CLK, and the timing is the same in either case. This option allows the use of non-compliant RMII PHYs.

Note:

In the following table, all timing specifications are referenced from REF_CLK = 1.4 V to the valid output levels, 0.8 V and 2.0 V.

RMII transmit signal valid timing specified is considering the rise/fall time of the ref_clk on the pad as 1ns.

Symbol		С	Characteristic	Va	lue	Unit	
Symbol		C	Characteristic	Min	Max	Oill	
R5	СС	D	REF_CLK to TXD[1:0], TX_EN invalid	2	_	ns

The following table describes the CAN timing.

Table 56. CAN timing

Symbol	ı	С	Parameter	Condition		Value		Unit	
Syllibol		C	Farameter	Condition	Min	Тур	Max	Oille	
	CC	D	CAN	Medium type pads 25 pF load	_	_	70		
t _{P(RX:TX)}	СС	D	controller	Medium type pads 50 pF load	_	_	80	ns	
	СС	D	delay time standard - pads	STRONG, VERY STRONG type pads 25 pF load	_	_	60		
	СС	D		STRONG, VERY STRONG type pads 50 pF load	_	_	65		
	СС	D	CAN	Medium type pads 25 pF load	_	_	90		
	СС	D	CAN controller	Medium type pads 50 pF load	_	_	100		
t _{PLP(RX:TX)}	СС	D	propagation delay time low power	STRONG, VERY STRONG type pads 25 pF load	_	_	80	ns	
	СС	D	pads	STRONG, VERY STRONG type pads 50 pF load	_	_	85		

4.17.5 UART timing

UART channel frequency support is shown in the following table.

Table 57. UART frequency support

LINFlexD clock frequency LIN_CLK (MHz)	Oversampling rate	Voting scheme	Max usable frequency (Mbaud)
	16	3:1 majority voting	5
	8	3.1 majority voting	10
80	6	Limited voting on one	13.33
	5	sample with configurable	16
	4	sampling point	20
	16	- 3:1 majority voting	6.25
	8	- 3.1 majority voting	12.5
100	6	Limited voting on one	16.67
	5	sample with configurable	20
	4	sampling point	25

4.17.6 I2C timing

The I²C AC timing specifications are provided in the following tables.

Note:

In the following table, I2C input timing is valid for Automotive and TTL inputs levels, hysteresis enabled, and an input edge rate no slower than 1 ns (10 % – 90 %).

Table 58. I2C input timing specifications - SCL and SDA

No.	lo. Symbol		С	Parameter	Va	ue	Unit	
NO.	Зу	iliboi)	Falanielei	Min	Max	Ollit	
1	_	СС	D	Start condition hold time	2	_	PER_CLK Cycle ⁽¹⁾	
2		CC	D	Clock low time	8	_	PER_CLK Cycle	
3		CC	D	Bus free time between Start and Stop condition	4.7	_	μs	
4	_	СС	D	Data hold time	0.0	_	ns	
5	_	СС	D	Clock high time	4	_	PER_CLK Cycle	
6	_	СС	D	Data setup time	0.0	_	ns	
7	_	СС	D	Start condition setup time (for repeated start condition only)	2	_	PER_CLK Cycle	
8	_	CC	D	Stop condition setup time	2	_	PER_CLK Cycle	

PER_CLK is the SoC peripheral clock, which drives the I²C BIU and module clock inputs. See the Clocking chapter in the device reference manual for more detail.

Note: In the following table:

- All output timing is worst case and includes the mismatching of rise and fall times of the output pads.
- Output parameters are valid for CL = 25 pF, where CL is the external load to the device (lumped). The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.
- Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.
- Programming the IBFD register (I2C bus Frequency Divider) with the maximum frequency results in the minimum output timings listed. The I2C interface is designed to scale the data transition time, moving it to the middle of the SCL low period. The actual position is affected by the pre-scale and division values programmed in the IBC field of the IBFD register.

Table 59. I2C output timing specifications — SCL and SDA

No.	Symbol		C	Parameter	Value		Unit
NO.					Min	Max	Oilli
1	_	СС	D	Start condition hold time	6	_	PER_CLK Cycle ⁽¹⁾
2	_	СС	D	Clock low time	10	_	PER_CLK Cycle
3	_	CC	D	Bus free time between Start and Stop condition	4.7	_	μs
4	_	СС	D	Data hold time	7	_	PER_CLK Cycle
5	_	CC	D	Clock high time	10	_	PER_CLK Cycle
6	_	CC	D	Data setup time	2	_	PER_CLK Cycle
7	_	СС	D	Start condition setup time (for repeated start condition only)	20	_	PER_CLK Cycle
8	_	CC	D	Stop condition setup time	10	_	PER_CLK Cycle

PER_CLK is the SoC peripheral clock, which drives the I²C BIU and module clock inputs. See the Clocking chapter in the device reference manual for more detail.

Figure 42. I²C input/output timing

5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

The following table lists the case numbers for SPC584Bx.

Table 60. Package case numbers

5.1.1 Package mechanical drawings and data information

The following notes are related to Figure 43, Figure 44, Figure 45 and Table 61:

- Dimensioning and tolerancing schemes conform to ASME Y14.5M-1994.
- 2. The Top package body size may be smaller than the bottom package size by as much as 0.15 mm.
- 3. Datums A-B and D to be determined at datum plane H.
- 4. To be determined at seating datum plane C.
- 5. Dimensions D1 and E1 do not include mold flash or protrusions. Allowable mold flash or protrusions is "0.25 mm" per side. D1 and E1 are Maximum plastic body size dimensions including mold mismatch.
- 6. Details of pin 1 identifier are optional but must be located within the zone indicated.
- 7. All dimensions are in millimeter except where explicitly noted.
- 8. No intrusion allowed inwards the leads.
- 9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum "b" dimension by more than 0.08 mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
- 10. Exact shape of each corner is optional.
- 11. These dimensions apply to the flat section of the lead between 0.10 mm and 0.25 mm from the lead tip.
- 12. A1 is defined as the distance from the seating plane to the lowest point on the package body.
- 13. Dimensions D2 and E2 show the maximum exposed metal area on the package surface where the exposed pad is located (if present). It includes all metal protrusions from exposed pad itself. Type of exposed pad on SPC584Bx(variable) is as *Figure 46*. End user should verify D2 and E2 dimensions according to the specific device application.
- 14. Dimensions D3 and E3 show the minimum solderable area, defined as the portion of exposed pad which is guaranteed to be free from resin flashes/bleeds, bordered by internal edge of inner groove.
- 15. The optional exposed pad is generally coincident with the top or bottom side of the package and not allowed to protrude beyond that surface.
- 16. "N" is the max number of terminal positions for the specified body size.
- 17. Critical dimensions:
 - a) Stand-Off
 - b) Overall Width
 - c) Lead Coplanarity
- 18. For symbols, recommended values and tolerances, see *Table 62*.
- 19. Notch may be present in this area (MAX 1.5mm square) if center top gate molding technology is applied. Resin gate residual not protruding out of package top surface.

SPC584Bx Package information

Figure 46. eTQFP64 leadframe pad design

Table 62. eTQFP64 symbol definitions

Symbol	Definition	Notes
aaa	The tolerance that controls the position of the terminal pattern with respect to Datum A and B. The center of the tolerance zone for each terminal is defined by basic dimension e as related to Datum A and B.	For flange-molded packages, this tolerance also applies for basic dimensions D1 and E1. For packages tooled with intentional terminal tip protrusions, aaa does not apply to those protrusions.
bbb	The bilateral profile tolerance that controls the position of the plastic body sides. The centers of the profile zones are defined by the basic dimensions D and E.	_
ccc	The unilateral tolerance located above the seating plane where in the bottom surface of all terminals must be located.	This tolerance is commonly know as the "coplanarity" of the package terminals.
ddd	The tolerance that controls the position of the terminals to each other. The centers of the profile zones are defined by basic dimension e.	This tolerance is normally compounded with tolerance zone defined by "b".

SPC584Bx Package information

5.4.1 Package mechanical drawings and data information

The following notes are related to Figure 55, Figure 56, Figure 57 and Table 67:

- 1. Dimensioning and tolerancing schemes conform to ASME Y14.5M-1994.
- 2. The Top package body size may be smaller than the bottom package size by as much as 0.15 mm.
- Datums A-B and D to be determined at datum plane H.
- 4. To be determined at seating datum plane C.
- 5. Dimensions D1 and E1 do not include mold flash or protrusions. Allowable mold flash or protrusions is "0.25 mm" per side. D1 and E1 are Maximum plastic body size dimensions including mold mismatch.
- 6. Details of pin 1 identifier are optional but must be located within the zone indicated.
- 7. All dimensions are in millimeter except where explicitly noted.
- 8. No intrusion allowed inwards the leads.
- 9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum "b" dimension by more than 0.08 mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
- 10. Exact shape of each corner is optional.
- 11. These dimensions apply to the flat section of the lead between 0.10 mm and 0.25 mm from the lead tip.
- 12. A1 is defined as the distance from the seating plane to the lowest point on the package body.
- 13. Dimensions D2 and E2 show the maximum exposed metal area on the package surface where the exposed pad is located (if present). It includes all metal protrusions from exposed pad itself. Type of exposed pad on SPC584Bx is as *Figure 58*. End user should verify D2 and E2 dimensions according to the specific device application.
- 14. Dimensions D3 and E3 show the minimum solderable area, defined as the portion of exposed pad which is guaranteed to be free from resin flashes/bleeds, bordered by internal edge of inner groove.
- 15. The optional exposed pad is generally coincident with the top or bottom side of the package and not allowed to protrude beyond that surface.
- 16. "N" is the max number of terminal positions for the specified body size.
- 17. Critical dimensions:
 - a) Stand-Off
 - b) Overall Width
 - c) Lead Coplanarity
- 18. For symbols, recommended values and tolerances, see *Table 68*.

47/

DS11701 Rev 4 121/142

Figure 58. eLQFP176 leadframe pad design

Table 68. eLQFP176 symbol definitions

Symbol	Definition	Notes
aaa	The tolerance that controls the position of the terminal pattern with respect to Datum A and B. The center of the tolerance zone for each terminal is defined by basic dimension e as related to Datum A and B.	For flange-molded packages, this tolerance also applies for basic dimensions D1 and E1. For packages tooled with intentional terminal tip protrusions, aaa does not apply to those protrusions.
bbb	The bilateral profile tolerance that controls the position of the plastic body sides. The centers of the profile zones are defined by the basic dimensions D and E.	_
ccc	The unilateral tolerance located above the seating plane where in the bottom surface of all terminals must be located.	This tolerance is commonly know as the "coplanarity" of the package terminals.
ddd	The tolerance that controls the position of the terminals to each other. The centers of the profile zones are defined by basic dimension e.	This tolerance is normally compounded with tolerance zone defined by "b".

SPC584Bx Package information

5.5 Package thermal characteristics

The following tables describe the thermal characteristics of the device. The parameters in this chapter have been evaluated by considering the device consumption configuration reported in the *Section 4.7: Device consumption*.

5.5.1 eTQFP64

Table 69. Thermal characteristics for 64 exposed pad eTQFP package

Symbo	Symbol C		Parameter ⁽¹⁾	Conditions	Value	Unit
$R_{\theta JA}$	CC	D	Junction-to-Ambient, Natural Convection ⁽²⁾	Four layer board (2s2p)	30.8	°C/W
$R_{\theta JMA}$	СС	D	Junction-to-Moving-Air, Ambient ⁽²⁾	at 200 ft./min., four layer board (2s2p)	24.4	°C/W
$R_{\theta JB}$	СС	D	Junction-to-board ⁽³⁾	_	12.1	°C/W
$R_{\theta JCtop}$	СС	D	Junction-to-case top ⁽⁴⁾	_	15.2	°C/W
$R_{\theta JCbottom}$	СС	D	Junction-to-case bottom ⁽⁵⁾	_	4.5	°C/W
Ψ_{JT}	СС	D	Junction-to-package top ⁽⁶⁾	Natural convection	3.7	°C/W

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

- 2. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
- 3. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- 4. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- 5. Thermal resistance between the die and the exposed pad ground on the bottom of the package based on simulation without any interface resistance.
- Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

5.5.2 eTQFP100

Table 70. Thermal characteristics for 100 exposed pad eTQFP package

Symbo	Symbol C		Parameter ⁽¹⁾	Conditions	Value	Unit
$R_{ hetaJA}$	CC	D	Junction-to-Ambient, Natural Convection ⁽²⁾	Four layer board (2s2p)	28.9	°C/W
$R_{\theta JMA}$	СС	D	Junction-to-Moving-Air, Ambient ⁽²⁾	At 200 ft./min., four layer board (2s2p)	22.9	°C/W
$R_{\theta JB}$	СС	D	Junction-to-board ⁽³⁾	_	14.1	°C/W
$R_{\theta JCtop}$	СС	D	Junction-to-case top ⁽⁴⁾	_	14	°C/W
$R_{\theta JCbottom}$	СС	D	Junction-to-case bottom ⁽⁵⁾	_	4.4	°C/W
Ψ_{JT}	СС	D	Junction-to-package top ⁽⁶⁾	Natural convection	3.7	°C/W

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

DS11701 Rev 4 123/142

^{2.} Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.

Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

- 5. Thermal resistance between the die and the exposed pad ground on the bottom of the package based on simulation without any interface resistance.
- 6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

5.5.3 eTQFP144

Table 71. Thermal characteristics for 144 exposed pad eTQFP package

Symbo	Symbol C		Parameter ⁽¹⁾	Conditions	Value	Unit
$R_{\theta JA}$	CC	D	Junction-to-Ambient, Natural Convection ⁽²⁾	Four layer board (2s2p)	28.5	°C/W
$R_{ heta JMA}$	СС	D	Junction-to-Moving-Air, Ambient ⁽²⁾	At 200 ft./min., four layer board (2s2p)	22.1	°C/W
$R_{\theta JB}$	СС	D	Junction-to-board ⁽³⁾	_	14.5	°C/W
$R_{\theta JCtop}$	СС	D	Junction-to-case top ⁽⁴⁾	_	13.7	°C/W
$R_{\theta JCbottom}$	CC	D	Junction-to-case bottom ⁽⁵⁾	_	4.4	°C/W
Ψ_{JT}	СС	D	Junction-to-package top ⁽⁶⁾	Natural convection	3.7	°C/W

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance

- 2. Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.
- 3. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- Thermal resistance between the die and the exposed pad ground on the bottom of the package based on simulation without any interface resistance.
- Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

5.5.4 LQFP176

Table 72. Thermal characteristics for 176 exposed pad LQFP package

Symbo	Symbol C Parameter ⁽¹⁾		Conditions	Value	Unit	
$R_{\theta JA}$	CC	D	Junction-to-Ambient, Natural Convection ⁽²⁾	Four layer board (2s2p)	28	°C/W
$R_{ heta JMA}$	СС	D	Junction-to-Moving-Air, Ambient ⁽²⁾	at 200 ft./min., four layer board (2s2p)	21	°C/W
$R_{\theta JB}$	СС	D	Junction-to-board ⁽³⁾		15.7	°C/W
$R_{\theta JCtop}$	CC	D	Junction-to-case top ⁽⁴⁾		18.1	°C/W
$R_{\theta JCbottom}$	СС	D	Junction-to-case bottom ⁽⁵⁾	_	4.0	°C/W
Ψ_{JT}	СС	D	Junction-to-package top ⁽⁶⁾	Natural convection	3.7	°C/W

Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board)
temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal
resistance.

^{2.} Per JEDEC JESD51-6 with the board (JESD51-7) horizontal.

SPC584Bx Package information

Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

- Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- 5. Thermal resistance between the die and the exposed pad ground on the bottom of the package based on simulation without any interface resistance.
- Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

5.5.5 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_{.I}, can be obtained from the equation:

Equation 1 $T_J = T_A + (R_{\theta JA} * P_D)$

where:

T_A = ambient temperature for the package (°C)

R_{0.JA} = junction-to-ambient thermal resistance (°C/W)

 P_D = power dissipation in the package (W)

The thermal resistance values used are based on the JEDEC JESD51 series of standards to provide consistent values for estimations and comparisons. The differences between the values determined for the single-layer (1s) board compared to a four-layer board that has two signal layers, a power and a ground plane (2s2p), demonstrate that the effective thermal resistance is not a constant. The thermal resistance depends on the:

- Construction of the application board (number of planes)
- Effective size of the board which cools the component
- Quality of the thermal and electrical connections to the planes
- Power dissipated by adjacent components

Connect all the ground and power balls to the respective planes with one via per ball. Using fewer vias to connect the package to the planes reduces the thermal performance. Thinner planes also reduce the thermal performance. When the clearance between the vias leaves the planes virtually disconnected, the thermal performance is also greatly reduced.

As a general rule, the value obtained on a single-layer board is within the normal range for the tightly packed printed circuit board. The value obtained on a board with the internal planes is usually within the normal range if the application board has:

- One oz. (35 micron nominal thickness) internal planes
- Components are well separated
- Overall power dissipation on the board is less than 0.02 W/cm²

The thermal performance of any component depends on the power dissipation of the surrounding components. In addition, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device.

At a known board temperature, the junction temperature is estimated using the following equation:

DS11701 Rev 4 125/142

SPC584Bx Package information

Equation 2

$$T_J = T_B + (R_{\theta JB} * P_D)$$

where:

T_B = board temperature for the package perimeter (°C)

R_{0,JB} = junction-to-board thermal resistance (°C/W) per JESD51-8

 P_D = power dissipation in the package (W)

When the heat loss from the package case to the air does not factor into the calculation, the junction temperature is predictable if the application board is similar to the thermal test condition, with the component soldered to a board with internal planes.

The thermal resistance is expressed as the sum of a junction-to-case thermal resistance plus a case-to-ambient thermal resistance:

Equation 3

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

 $R_{\theta,IA}$ = junction-to-ambient thermal resistance (°C/W)

 $R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

 $R_{\theta CA}$ = case to ambient thermal resistance (°C/W)

R_{0,IC} is device related and is not affected by other factors. The thermal environment can be controlled to change the case-to-ambient thermal resistance, $R_{\theta CA}$. For example, change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This description is most useful for packages with heat sinks where 90% of the heat flow is through the case to heat sink to ambient. For most packages, a better model is required.

A more accurate two-resistor thermal model can be constructed from the junction-to-board thermal resistance and the junction-to-case thermal resistance. The junction-to-case thermal resistance describes when using a heat sink or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. This model can be used to generate simple estimations and for computational fluid dynamics (CFD) thermal models. More accurate compact Flotherm models can be generated upon request.

To determine the junction temperature of the device in the application on a prototype board, use the thermal characterization parameter $(\Psi_{,IT})$ to determine the junction temperature by measuring the temperature at the top center of the package case using the following equation:

Equation 4

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

 T_T = thermocouple temperature on top of the package (°C)

Ψ_{JT} = thermal characterization parameter (°C/W)

 P_D = power dissipation in the package (W)

126/142 DS11701 Rev 4

SPC584Bx Package information

The thermal characterization parameter is measured in compliance with the JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. Position the thermocouple so that the thermocouple junction rests on the package. Place a small amount of epoxy on the thermocouple junction and approximately 1 mm of wire extending from the junction. Place the thermocouple wire flat against the package case to avoid measurement errors caused by the cooling effects of the thermocouple wire.

When board temperature is perfectly defined below the device, it is possible to use the thermal characterization parameter (Ψ_{JPB}) to determine the junction temperature by measuring the temperature at the bottom center of the package case (exposed pad) using the following equation:

Equation 5

 $T_J = T_B + (\Psi_{JPB} \times P_D)$

where:

T_T = thermocouple temperature on bottom of the package (°C)

 Ψ_{JT} = thermal characterization parameter (°C/W)

 P_D = power dissipation in the package (W)

		For parameter f _{ADCK} (High frequency mode), changed min value from "7.5" to "> 13.33"
		Deleted footnote "Values are subject to change (possibly improved to ±2 LSB) after characterization"
		Added symbols t _{ADCINIT} and t _{ADCBIASINIT}
		Column "C" split and added "D" for I _{ADV S}
		Table 27: ADC-Comparator electrical specification
		Classification for parameter "I _{ADCREFH} " changed from "C" to "T"
		Removed table footnote "Values are subject to change (possibly improved to ±2 LSB) after characterization"
		Added new parameter "t _{ADCINITSBY} "
		Set min = $5/f_{ADCK}$ µs for 10-bit ADC mode, min = $2/f_{ADCK}$ " for ADC comparator mode, at symbol $t_{ADCSAMPLE}$
		Column "C" split and added "D" for I _{ADV S}
		Figure 8: Input equivalent circuit (Fast SARn and SARB channels): updated
16-Mar-2018	3	Section 3.13: Temperature Sensor
	(cont'd)	Table 28: Temperature sensor electrical characteristics:
		For "temperature monitoring range": classification removed (was C)
		Section 4.14: LFAST pad electrical characteristics:
		Introduction paragraph:
		 1st sentence: hidden text "both the SIPI and"
		all 2nd sentence hidden: "The same LVDS tables"
		Figure 9: LFAST LVDS timing definition:
		Title changed to "LFAST LVDS timing definition"
		Deleted:
		- 400 mV p-p (MSC/DSPI)
		- 0.50 * T (MSC/DSPI)
		- (MSC/DSPI)
		Table 29: LVDS pad startup and receiver electrical characteristics,:
		For parameter I _{LVDS_BIAS} , changed the characteristics to "C"
		Table 31: LFAST PLL electrical characteristics: Min and May value of parameter "ERP " undated from "TRD" to " 1" and
		- Min and Max value of parameter "ERR _{REF} " updated from "TBD" to "-1" and "+1" respectively Maximum of maximum of the parameter "ENN" and dated from "TBD" to ".50".
		- Max value of parameter "PN" updated from "TBD" to "-58"
		- Frequency of parameter "ΔPER _{REF} " updated from "10MHz" to "20MHz"
		 – Max value of parameter "∆PER_{REF}" for condition "Single period" updated from "TBD" to "350"

Table 75. Document revision history (continued)

Date		75. Document revision history (continued) Changes
Date	1/64191011	, and the second
Date	Revision	Changes - Min and Max value of parameter "\DPER_REF" for condition "Long period" updated from "TBD" to "-500" and "+500" respectively Section 4.15: Power management Section 4.15.1: Power management integration Added sentence "It is recommendeddevice itself" for all devices Figure 17: Voltage monitor threshold definition: Updated figure Table 32: Power management regulators Removed text "In parts packaged with LQFP176, the auxiliary and clamp regulators cannot be enabled" from note 2 Table 33: External components integration For PMOS, replaced "STT4P3LLH6" with "PMPB100XPEA" For NMOS, replaced "STT6N3LLH6" with "PMPB55XNEA" Added table footnote to typ value of C _{S2} Removed table footnote "External components number" Updated Min and Max values at symbol C _E to 1.1 and 3.0 respectively Table 34: Linear regulator specifications Classification of parameter "IDD _{MREG} " changed from "P" to "T" Classification of parameter "IDD _{MREG} " changed from "T" to "P"
16-Mar-2018	3 (cont'd)	Removed text "In parts packaged with LQFP176, the auxiliary and clamp regulators cannot be enabled" from note 2 Table 33: External components integration For PMOS, replaced "STT4P3LLH6" with "PMPB100XPEA" For NMOS, replaced "STT6N3LLH6" with "PMPB55XNEA" Added table footnote to typ value of C_{S2} Removed table footnote "External components number" Updated Min and Max values at symbol C_{E} to 1.1 and 3.0 respectively Table 34: Linear regulator specifications Classification of parameter "IDD $_{MREG}$ " changed from "P" to "T" Classification of parameter "IDD $_{MREG}$ " changed from "T" to "P" Updated values for symbol " $_{\Delta}$ IDD $_{MREG}$ ": — Min: added -100 — Max: added 100 Updated TBD values Table 35: Auxiliary regulator specifications: added table
		Table 36: Clamp regulator specifications: added table Table 38: Voltage monitor electrical characteristics: V _{POR031_C} : changed the max value from 0.85 to 0.97 T _{VMFILTER} : replaced T with D Min value of "V _{POR200_C} " updated from "1.96" to "1.80" Max value of "V _{POR031_C} " updated from ".85" "0.97" Changed the min value of parameter V _{POR200_C} from "1.96" to "1.80" Changed the max value of parameter V _{POR031_C} from "0.85" to "0.97" Changed the condition of parameter T _{VMFILTER} from "T" to "D" In Supply/Parameter: Replaced "_FLEX" by "_ETH" for V _{LVD290_IF} , V _{LVD400_IF} V _{HVD400_IF} and V _{UVD600_IF} symbols Added symbol V _{UVD600_F} Section 3.16: Flash Table 39: Wait state configuration: added column for "APC" and table footnotes, other columns updated
		Table 40: Flash memory program and erase specifications: updated Table 38: Flash memory Life Specification: updated

Table 75. Document revision history (continued)

Date	Revision	Changes
16-Mar-2018	3 (cont'd)	Table 43: Nexus debug port timing: Classification of parameters "t _{EVTIPW} " and "t _{EVTOPW} " changed from "P" to "D" Table 45: DSPI channel frequency support Added column to show slower and faster frequencies Added DSPI_5 to lower frequency and removed it from higher frequency Table 46: DSPI CMOS master classic timing (full duplex and output only) MTFE = 0, CPHA = 0 or 1 Changed the Min value of t _{SCK} (very strong) from 33 to 59 Table 56: CAN timing: Added columns for "CC" and "D" Section 4: Package information Table 61: eTQFP64 package mechanical data Deleted angle lines Updated values for D2, D3, E2, E3 and ddd Table 62: eTQFP100 package mechanical data Deleted angle lines Table 64: eLQFP176 package mechanical data Updated values for D2 and E2 Figure 43: eTQFP64 package outline: Removed "6.2x6.2 mm" after "eTQFP 10x10x1.0." Figure 44: eTQFP100 package outline Removed "6.4x6.4 mm" after "eTQFP 14x14x1.0" Table 69: Thermal characteristics for 64 exposed pad eTQFP package: Updated all parameters values Table 70: Thermal characteristics for 100 exposed pad eTQFP package: Updated all parameters values Table 71: Thermal characteristics for 144 exposed pad eTQFP package: Updated all parameters values Table 72: Thermal characteristics for 176 exposed pad LQFP package: Updated all parameters values Section 6: Ordering information Figure 59: Ordering information scheme: Removed "R" value for the Packing options Replaced "X" by "0" for Silicon revision Added ""pin 1 top right" to "X" description in Packing Table 73: Code Flash options and Table 74: RAM options: added these tables

Table 75. Document revision history (continued)

Date	Revision	Changes
		Section 1: Introduction: Removed "Document overview" section title. Section 2: Description: Changed title type.
10-Sep-2019	4	Section 4.2: Absolute maximum ratings Table 4: Absolute maximum ratings: Added cross reference to footnote ⁽²⁾ to all V _{DD_HV*} and V _{IN} Section 4.3: Operating conditions: V _{DD_HV_ADR_S} : Removed line for C condition. Section 4.5: Electromagnetic compatibility characteristics: Updated section title from "Electromagnetic emission characteristics" to Section 4.5: Electromagnetic compatibility characteristics: Updated section title from "Electromagnetic compatibility characteristics. Section 4.7: Device consumption Table 8: Device consumption: - Updated maximum values of all conditions and changed from 'P' to 'C' in C column at TJ=40 °C condition for I _{DDSTBY8} , I _{DDSTBY32} and I _{DDSTBY128} parameters. - Moved table footnote 1. from table title to "Value". Section 4.9: Reset pad (PORST) electrical characteristics Figure 5: Startup Reset requirements: Deleted V _{DDMIN} . Section 4.10: PLLs - Table 19: PLL0 electrical characteristics: Changed condition from T to D for IAPLLOPHITSPJI, ΔPLLOLTJ and I _{PLLO} . - Table 20: PLL1 electrical characteristics: Changed condition from T to D for IPLL1. Section 4.11: Oscillators: Table 23: Internal RC oscillator electrical specifications: Updated Max value for I _{FIRC} . Section 4.12: ADC system: - Figure 8: Input equivalent circuit (Fast SARn and SARB channels): Added parameter "C _{EXT} : external capacitance" and component to scheme. - Table 25: ADC pin specification: Added row for symbol "C _{EXT} / SR".

Table 75. Document revision history (continued)

Date	Revision	Changes
		Section 4.14: LFAST pad electrical characteristics:
		- Figure 9: LFAST LVDS timing definition: Updated.
		 Table 29: LVDS pad startup and receiver electrical characteristics,: Removed the last sentence of Note "Total internal capacitance".
		Section 4.15: Power management:
		 Table 33: External components integration: Updated conditions for C_{BV}. Table 38: Voltage monitor electrical characteristics: Added footnote "Even if LVD/HVD"
		Section 4.16: Flash:
		 Table 39: Wait state configuration: for APC=001 changed the minimum frequency from 40 to 55 MHz
		- Table 40: Flash memory program and erase specifications: Updated.
		Section 4.17: AC specifications:
		Section 4.17.3.7: RMII transmit signal timing (TXD[1:0], TX_EN): Added note "RMII transmit as 1 ns".
		Section 5: Package information:
		 Added introduction sentence in each Package section.
		 Added sub-section "Package mechanical drawings and data information" and introduction sentence to the notes list.
	4	- Table 60: Package case numbers: Removed package reference column.
		- Figure 43: eTQFP64 package outline: Updated.
10.0		- Figure 44: eTQFP64 section A-A: Added.
10-Sep-2019	(cont'd)	 Table 61: eTQFP64 package mechanical data: Updated table, notes content and numbering.
		 Section 5.1.1: Package mechanical drawings and data information: Moved notes to new section.
		- Figure 46: eTQFP64 leadframe pad design: Added.
		- Table 62: eTQFP64 symbol definitions: Added.
		- Figure 47: eTQFP100 package outline: Updated.
		- Figure 48: eTQFP100 section A-A: Added.
		- Figure 49: eTQFP100 section B-B: Added.
		 Table 63: eTQFP100 package mechanical data: Updated table, notes content and numbering.
		 Section 5.2.1: Package mechanical drawings and data information: Moved notes to new section.
		- Figure 50: eTQFP100 leadframe pad design: Updated.
		- Figure 51: eTQFP144 package outline: Updated.
		 Table 65: eTQFP144 package mechanical data: Updated table, notes content and numbering.
		 Section 5.3.1: Package mechanical drawings and data information: Moved notes to new section.
		- Figure 55: eLQFP176 package outline: Updated.
		- Figure 57: eLQFP176 section B-B: Added.
		 Table 67: eLQFP176 package mechanical data: Updated table, notes and numbering.

Table 75. Document revision history (continued)

Date	Revision	Changes
10-Sep-2019	4 (cont'd)	 Section 5.4.1: Package mechanical drawings and data information: Moved notes to new section. Table 68: eLQFP176 symbol definitions: Updated. Table 72: Thermal characteristics for 176 exposed pad LQFP package: Updated values. Section 6: Ordering information Figure 59: Ordering information scheme: Added figure footnotes. Removed "F = Security HW + ST Firmware" in security.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
