TLD5095EL

## 1 Overview

### Features

- Wide Input Voltage Range from 4.75 V to 45 V
- Constant Current or Constant Voltage Regulation
- Drives LEDs in Boost, Buck, Buck-Boost, SEPIC and Flyback Topology
- Very Low Shutdown Current:  $I_Q < 10 \mu A$
- Flexible Switching Frequency Range, 100 kHz to 500 kHz
- Synchronization with external clock source
- Output Open Circuit Diagnostic Output
- PWM Dimming
- Internal Soft Start
- 300mV High Side Current Sense to ensure highest flexibility and LED current accuracy
- Internal 5 V Low Drop Out Voltage Regulator
- Wide LED current range via simple adaptation of external components
- Available in a small thermally enhanced PG-SSOP-14 package
- Output Overvoltage Protection
- Over Temperature Shutdown
- Automotive AEC Qualified
- Green Product (RoHS) Compliant

PG-SSOP-14

### Description

The TLD5095EL is a smart multitopology LED controller with built in protection and diagnostic features. The main function of this device is to regulate a constant LED current. The constant current regulation is especially beneficial for LED color accuracy and longer lifetime. The controller concept of the TLD5095EL allows a multi-purpose usage such as Boost, Buck, Buck-Boost, SEPIC and Flyback configuration with various load current levels by simply adjusting the external components. The TLD5095EL has a PWM output for dimming a LED load. The diagnostics are communicated on a status output (pin ST) to indicate a fault condition such as an LED open circuit. The switching frequency is adjustable in the range of 100 kHz to 500 kHz and can be synchronized to an external clock source. The TLD5095EL features an enable function reducing the shut-down current consumption to  $< 10 \mu A$ . The current mode regulation scheme of this device provides a stable regulation loop maintained by small external compensation components. The integrated soft-start feature limits the current peak as well as voltage overshoot at start-up. This IC is suited for use in the harsh automotive environments and provides protection functions such as output overvoltage protection and overtemperature shutdown.

#### 3.2 Pin Definitions and Functions

Pin	Symbol	Function
1	IVCC	<b>Internal LDO Output;</b> Used for internal biasing and gate drive. Bypass with external capacitor. Pin must not left open.
2	SWO	<b>Switch Output;</b> Connect to gate of external switching MOSFET
3	SGND	<b>Current Sense Ground;</b> Ground return for current sense switch
4	SWCS	<b>Current Sense Input;</b> Detects the peak current through switch
5	PWMO	<b>PWM Dimming Output;</b> Connect to gate of external MOSFET
6	FBH	<b>Voltage Feedback Positive;</b> Non inverting Input (+)
7	FBL	<b>Voltage Feedback Negative;</b> Inverting Input (-)
8	COMP	<b>Compensation Input;</b> Connect R and C network to pin for stability

Pin Configuration

Pin	Symbol	Function
9	OVFB	<b>Output Overvoltage Protection Feedback;</b> Connect to resistive voltage divider to set overvoltage threshold.
10	ST	<b>Status Output;</b> Open drain diagnostic output to indicate fault condition. Connect pull up resistor to pin.
11	FREQ / SYNC	<b>Frequency Select or Synchronization Input;</b> Connect external resistor to GND to set frequency. Or apply external clock signal for synchronization within frequency capture range.
12	GND	<b>Ground;</b> Connect to system ground.
13	EN / PWMI	<b>Enable or PWM Input;</b> Apply logic high signal to enable device or PWM signal for dimming LED.
14	IN	<b>Supply Input;</b> Supply for internal biasing.
EP		<b>Exposed Pad;</b> Connect to external heat spreading Cu area with electrically GND (e.g. inner GND layer of multilayer PCB with thermal vias)

- 1) Not subject to production test, specified by design.
- 2) Specified  $R_{thJC}$  value is simulated at natural convection on a cold plate setup (all pins and exposed pad are fixed to ambient temperature).  $T_a=25\text{°C}$ , IC is dissipating 1W.
- 3) Specified  $R_{thJA}$  value is according to JEDEC 2s2p (JESD 51-7) + (JESD 51-5) and JEDEC 1s0p (JESD 51-3) + heatsink area at natural convection on FR4 board; The device was simulated on a 76.2 x 114.3 x 1.5mm board. The 2s2p board has 2 outer copper layers (2 x 70μm Cu) and 2 inner copper layers (2 x 35μm Cu), A thermal via (diameter = 0.3mm and 25μm plating) array was applied under the exposed pad and connected the first outer layer (top) to the first inner layer and second outer layer (bottom) of the JEDEC PCB.  $T_a=25\text{°C}$ , IC is dissipating 1W.

## 5 Regulator

### 5.1 Description

The TLD5095 regulator is suitable for Boost, Buck, Buck-Boost, SEPIC and Flyback configurations. The constant output current is especially useful for light emitting diode (LED) applications. The regulator function is implemented by a pulse width modulated (PWM) current mode controller.

The PWM current mode controller uses the peak current through the external power switch and error in the output current to determine the appropriate pulse width duty cycle (on time) for constant output current. The current mode controller it provides a PWM signal to an internal gate driver which then outputs the same PWM signal to external n-channel enhancement mode metal oxide field effect transistor (MOSFET) power switch.

The current mode controller also has built-in slope compensation to prevent sub-harmonic oscillations which is a characteristic of current mode controllers operating at high duty cycles (>50% duty).

An additional built-in feature is an integrated soft start that limits the current through the inductor and external power switch during initialization. The soft start function gradually increases the inductor and switch current over 1 ms (typical) to minimize potential overvoltage at the output.

## 6 Oscillator and Synchronization

### 6.1 Description

R\_ OSC vs. switching frequency

The internal oscillator is used to determine the switching frequency of the multitopology regulator. The switching frequency can be selected from 100 kHz to 500 kHz with an external resistor to GND. To set the switching frequency with an external resistor the following formula can be applied.

$$R_{FREQ} = \frac{1}{\left(141 \times 10^{-12} \left[\frac{s}{\Omega}\right]\right) \times \left(f_{FREQ} \left[\frac{1}{s}\right]\right)} - \left(3.5 \times 10^3 [\Omega]\right) [\Omega]$$

In addition, the oscillator is capable of changing from the frequency set by the external resistor to a synchronized frequency from an external clock source. If an external clock source is provided on the pin FREQ/SYNC, then the internal oscillator synchronizes to this external clock frequency and the multitopology regulator switches at the synchronized frequency. The synchronization frequency capture range is 250 kHz to 500 kHz.

## 7 Enable and Dimming Function

### 7.1 Description

The enable function powers on or off the device. A valid logic low signal on enable pin EN/PWMI powers off the device and current consumption is less than 10  $\mu\text{A}$ . A valid logic high enable signal on enable pin EN/PWMI powers on the device. The enable function features an integrated pull down resistor which ensures that the IC is shut down and the power switch is off in case the enable pin EN is left open.

In addition to the enable function described above, the EN/PWMI pin detects a pulse width modulated (PWM) input signal that is fed through to an internal gate driver. The internal gate driver outputs the same PWM signal on the PWMO pin to an external n-channel enhancement mode MOSFET for PWM dimming an LED load. PWM dimming an LED is a commonly practiced dimming method to prevent color shift in an LED light source. Moreover the PWM output function may also be used for to drive other types of loads besides LED.

The enable and PWM input function share the same pin. Therefore a valid logic low signal at the EN/PWMI pin needs to differentiate between an enable power off signal or an PWM low signal. The device differentiates between an enable off command and PWM dimming signal by requiring the signal at the EN/PWMI pin to stay low for a minimum of 8 ms.

## 8 Linear Regulator

### 8.1 Description

The internal linear voltage regulator supplies the internal gate drivers with a typical voltage of 5 V and current up to  $I_{LIM,min}$  (parameter 8.2.2). An external output capacitor with ESR lower than  $R_{IVCC,ESR}$  (parameter 8.2.5) is required on pin IVCC for stability and buffering transient load currents. During normal operation the external MOSFET switches will draw transient currents from the linear regulator and its output capacitor. Proper sizing of the output capacitor must be considered to supply sufficient peak current to the gate of the external MOSFET switches.

#### Integrated undervoltage protection for the external switching MOSFET:

An integrated undervoltage reset threshold circuit monitors the linear regulator output voltage ( $V_{IVCC}$ ) and resets the device in case the output voltage falls below the IVCC undervoltage reset switch OFF threshold ( $V_{IVCC,RTH,d}$ ). The undervoltage reset threshold for the IVCC pin helps to protect the external switches from excessive power dissipation by ensuring the gate drive voltage is sufficient to enhance the gate of an external logic level n-channel MOSFET.

## 9 Protection and Diagnostic Functions

### 9.1 Description

The TLD5095EL has integrated circuits to diagnose and protect against output overvoltage, open load, open feedback and overtemperature faults. In case any of the four fault conditions occur the Status output ST will output an active logic low signal to communicate that a fault has occurred. During an overvoltage or open load condition the gate driver outputs SWO and PWMO will turn off. **Figure 11** illustrates the various open load and open feedback conditions. In the event of an overtemperature condition (**Figure 14**) the integrated thermal shutdown function turns off the gate drivers and internal linear voltage regulator. The typical junction shutdown temperature is 175°C. After cooling down the IC will automatically restart operation. Thermal shutdown is an integrated protection function designed to prevent immediate IC destruction and is not intended for continuous use in normal operation.

### Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
