## GENERAL DESCRIPTION

The ADMV8432 is a monolithic microwave integrated circuit (MMIC), tunable band-pass filter that features a user selectable pass-band frequency. The 3 dB filter bandwidth is  $>17\%$  of the center frequency ( $f_{\text{CENTER}}$ ). Additionally,  $f_{\text{CENTER}}$  can be varied between 16.5 GHz to 29.5 GHz by applying an analog tuning voltage between 0 V to 15 V. This tunable filter can be used as a

much smaller alternative to physically large switched filter banks and cavity tuned filters. This tunable filter has excellent microphonics due to the monolithic design and provides a dynamically adjustable solution in advanced communications applications.

## THEORY OF OPERATION

The ADMV8432 is a MMIC, band-pass filter that features a user selectable pass-band frequency. To select the high band, apply 0 V at VCTL, and to select the low band, apply 2.5 V at VCTL. Varying the applied analog tuning voltage between 0 V

and 15 V at VTUNE varies the  $f_{\text{CENTER}}$  from 16.5 GHz to 23.5 GHz for the low band and from 24.2 GHz to 29.5 GHz for the high band.
