Monolithic CMOS Analog Switches

FN3284
Rev 11.00

The DG401 and DG403 monolithic CMOS analog switches have TTL and CMOS compatible digital inputs.

These switches feature low analog ON resistance (<45Ω) and fast switch time (t_{ON}<150ns). Low charge injection simplifies sample and hold applications.

The improvements in the DG401, DG403 series are made possible by using a high voltage silicon-gate process. An epitaxial layer prevents the latch-up associated with older CMOS technologies. The 44V maximum voltage range permits controlling 30V_{P-P} signals. Power supplies may be single-ended from +5V to +34V, or split from ±5V to ±17V.

The analog switches are bilateral, equally matched for AC or bidirectional signals. The ON resistance variation with analog signals is quite low over a ±15V analog input range. The three different devices provide the equivalent of two SPST (DG401) or two SPDT (DG403) relay switch contacts with CMOS or TTL level activation. The pinout is similar, permitting a standard layout to be used, choosing the switch function as needed.

Application Information

Dual Slope Integrators

The DG403 is well suited to configure a selectable slope integrator. One control signal selects the timing capacitor C_1 or C_2 . Another one selects e_{IN} or discharges the capacitor in preparation for the next integration cycle.

FIGURE 8. DUAL SLOPE INTEGRATOR

Peak Detector

A_3 acting as a comparator provides the logic drive for operating SW_1 . The output of A_2 is fed back to A_3 and compared to the analog input e_{IN} . If $e_{IN} > e_{OUT}$ the output of A_3 is high keeping SW_1 closed. This allows C_1 to charge up to the analog input voltage. When e_{IN} goes below e_{OUT} , A_3 goes negative, turning SW_1 off. The system will therefore store the most positive analog input experienced.
