

2.7V 12-Bit A/D Converter with SPI Serial Interface

Features

- 12-Bit Resolution
- ± 1 LSB max DNL
- ± 1 LSB max INL (MCP3201-B)
- ± 2 LSB max INL (MCP3201-C)
- On-chip Sample and Hold
- SPI Serial Interface (modes 0,0 and 1,1)
- Single Supply Operation: 2.7V - 5.5V
- 100 ksp/s Maximum Sampling Rate at $V_{DD} = 5V$
- 50 ksp/s Maximum Sampling Rate at $V_{DD} = 2.7V$
- Low-Power CMOS Technology
- 500 nA Typical Standby Current, 2 μA Maximum
- 400 μA Maximum Active Current at 5V
- Industrial Temp Range: $-40^{\circ}C$ to $+85^{\circ}C$
- 8-pin MSOP, PDIP, SOIC and TSSOP Packages

Applications

- Sensor Interface
- Process Control
- Data Acquisition
- Battery Operated Systems

Functional Block Diagram

Description

The Microchip Technology Inc. MCP3201 device is a successive approximation 12-bit Analog-to-Digital (A/D) Converter with on-board sample and hold circuitry. The device provides a single pseudo-differential input. Differential Nonlinearity (DNL) is specified at ± 1 LSB, and Integral Nonlinearity (INL) is offered in ± 1 LSB (MCP3201-B) and ± 2 LSB (MCP3201-C) versions. Communication with the device is done using a simple serial interface compatible with the SPI protocol. The device is capable of sample rates of up to 100 ksp/s at a clock rate of 1.6 MHz. The MCP3201 device operates over a broad voltage range (2.7V-5.5V). Low-current design permits operation with typical standby and active currents of only 500 nA and 300 μA , respectively. The device is offered in 8-pin MSOP, PDIP, TSSOP and 150 mil SOIC packages.

Package Types

MSOP, PDIP, SOIC, TSSOP

MCP3201

NOTES:

1.0 ELECTRICAL CHARACTERISTICS

1.1 Maximum Ratings†

V_{DD}	7.0V
All inputs and outputs w.r.t. V_{SS}	-0.6V to V_{DD} +0.6V
Storage temperature	-65°C to +150°C
Ambient temp. with power applied	-65°C to +125°C
ESD protection on all pins (HBM)	> 4 kV

†**Notice:** Stresses above those listed under “Maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

Electrical Specifications: All parameters apply at $V_{DD} = 5V$, $V_{SS} = 0V$, $V_{REF} = 5V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$, $f_{SAMPLE} = 100$ ksp/s, and $f_{CLK} = 16 * f_{SAMPLE}$, unless otherwise noted.

Parameter	Sym	Min	Typ	Max	Units	Conditions
Conversion Rate:						
Conversion Time	t_{CONV}	—	—	12	clock cycles	
Analog Input Sample Time	t_{SAMPLE}	1.5			clock cycles	
Throughput Rate	f_{SAMPLE}	—	—	100 50	ksp/s ksp/s	$V_{DD} = V_{REF} = 5V$ $V_{DD} = V_{REF} = 2.7V$
DC Accuracy:						
Resolution		12			bits	
Integral Nonlinearity	INL	— —	± 0.75 ± 1	± 1 ± 2	LSB LSB	MCP3201-B MCP3201-C
Differential Nonlinearity	DNL	—	± 0.5	± 1	LSB	No missing codes over temperature
Offset Error		—	± 1.25	± 3	LSB	
Gain Error		—	± 1.25	± 5	LSB	
Dynamic Performance:						
Total Harmonic Distortion	THD	—	-82	—	dB	$V_{IN} = 0.1V$ to $4.9V@1$ kHz
Signal to Noise and Distortion (SINAD)	SINAD	—	72	—	dB	$V_{IN} = 0.1V$ to $4.9V@1$ kHz
Spurious Free Dynamic Range	SFDR	—	86	—	dB	$V_{IN} = 0.1V$ to $4.9V@1$ kHz
Reference Input:						
Voltage Range		0.25	—	V_{DD}	V	Note 2
Current Drain		— —	100 .001	150 3	μA μA	$CS = V_{DD} = 5V$
Analog Inputs:						
Input Voltage Range (IN+)	IN+	IN-	—	$V_{REF} + IN-$	V	
Input Voltage Range (IN-)	IN-	$V_{SS} - 100$		$V_{SS} + 100$	mV	
Leakage Current		—	0.001	± 1	μA	
Switch Resistance	R_{SS}	—	1K	—	W	See Figure 4-1
Sample Capacitor	C_{SAMPLE}	—	20	—	pF	See Figure 4-1
Digital Input/Output:						
Data Coding Format		Straight Binary				
High Level Input Voltage	V_{IH}	$0.7 V_{DD}$	—	—	V	
Low Level Input Voltage	V_{IL}	—	—	$0.3 V_{DD}$	V	

Note 1: This parameter is established by characterization and not 100% tested.

2: See graph that relates linearity performance to V_{REF} level.

3: Because the sample cap will eventually lose charge, effective clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures. See [Section 6.2 “Maintaining Minimum Clock Speed”](#) for more information.

ELECTRICAL CHARACTERISTICS (CONTINUED)

Electrical Specifications: All parameters apply at $V_{DD} = 5V$, $V_{SS} = 0V$, $V_{REF} = 5V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$, $f_{SAMPLE} = 100$ ksp/s, and $f_{CLK} = 16 \cdot f_{SAMPLE}$, unless otherwise noted.

Parameter	Sym	Min	Typ	Max	Units	Conditions
High Level Output Voltage	V_{OH}	4.1	—	—	V	$I_{OH} = -1$ mA, $V_{DD} = 4.5V$
Low Level Output Voltage	V_{OL}	—	—	0.4	V	$I_{OL} = 1$ mA, $V_{DD} = 4.5V$
Input Leakage Current	I_{LI}	-10	—	10	μA	$V_{IN} = V_{SS}$ or V_{DD}
Output Leakage Current	I_{LO}	-10	—	10	μA	$V_{OUT} = V_{SS}$ or V_{DD}
Pin Capacitance (all inputs/outputs)	C_{IN} , C_{OUT}	—	—	10	pF	$V_{DD} = 5.0V$ (Note 1) $T_A = +25^{\circ}C$, $f = 1$ MHz
Timing Parameters:						
Clock Frequency	f_{CLK}	—	—	1.6 0.8	MHz MHz	$V_{DD} = 5V$ (Note 3) $V_{DD} = 2.7V$ (Note 3)
Clock High Time	t_{HI}	312	—	—	ns	
Clock Low Time	t_{LO}	312	—	—	ns	
$\overline{CS}$ Fall To First Rising CLK Edge	t_{SUCS}	100	—	—	ns	
CLK Fall To Output Data Valid	t_{DO}	—	—	200	ns	See Test Circuits, Figure 1-2
CLK Fall To Output Enable	t_{EN}	—	—	200	ns	See Test Circuits, Figure 1-2
$\overline{CS}$ Rise To Output Disable	t_{DIS}	—	—	100	ns	See Test Circuits, Figure 1-2 (Note 1)
$\overline{CS}$ Disable Time	t_{CSH}	625	—	—	ns	
D_{OUT} Rise Time	t_R	—	—	100	ns	See Test Circuits, Figure 1-2 (Note 1)
D_{OUT} Fall Time	t_F	—	—	100	ns	See Test Circuits, Figure 1-2 (Note 1)
Power Requirements:						
Operating Voltage	V_{DD}	2.7	—	5.5	V	
Operating Current	I_{DD}	—	300 210	400 —	μA μA	$V_{DD} = 5.0V$, D_{OUT} unloaded $V_{DD} = 2.7V$, D_{OUT} unloaded
Standby Current	I_{DDs}	—	0.5	2	μA	$\overline{CS} = V_{DD} = 5.0V$

Note 1: This parameter is established by characterization and not 100% tested.

2: See graph that relates linearity performance to V_{REF} level.

3: Because the sample cap will eventually lose charge, effective clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures. See [Section 6.2 “Maintaining Minimum Clock Speed”](#) for more information.

TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, $V_{DD} = +2.7V$ to $+5.5V$, $V_{SS} = GND$.

Parameters	Sym	Min	Typ	Max	Units	Conditions
Temperature Ranges						
Specified Temperature Range	T_A	-40	—	+85	$^{\circ}C$	
Operating Temperature Range	T_A	-40	—	+85	$^{\circ}C$	
Storage Temperature Range	T_A	-65	—	+150	$^{\circ}C$	
Thermal Package Resistances						
Thermal Resistance, 8L-MSOP	θ_{JA}	—	211	—	$^{\circ}C/W$	
Thermal Resistance, 8L-PDIP	θ_{JA}	—	89.5	—	$^{\circ}C/W$	
Thermal Resistance, 8L-SOIC	θ_{JA}	—	149.5	—	$^{\circ}C/W$

NOTES:

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

Additional descriptions of the device pins follows.

TABLE 3-1: PIN FUNCTION TABLE

MCP3201	Symbol	Description
MSOP, PDIP, SOIC, TSSOP		
1	V_{REF}	Reference Voltage Input
2	IN+	Positive Analog Input
3	IN-	Negative Analog Input
4	V_{SS}	Ground
5	$\overline{CS}/SHDN$	Chip Select/Shutdown Input
6	D_{OUT}	Serial Data Out
7	CLK	Serial Clock
8	V_{DD}	+2.7V to 5.5V Power Supply

3.1 Positive Analog Input (IN+)

Positive analog input. This input can vary from IN- to $V_{REF} + IN-$.

3.2 Negative Analog Input (IN-)

Negative analog input. This input can vary ± 100 mV from V_{SS} .

3.3 Chip Select/Shutdown ($\overline{CS}/SHDN$)

The $\overline{CS}/SHDN$ pin is used to initiate communication with the device when pulled low and will end a conversion and put the device in low power standby when pulled high. The $\overline{CS}/SHDN$ pin must be pulled high between conversions.

3.4 Serial Clock (CLK)

The SPI clock pin is used to initiate a conversion and to clock out each bit of the conversion as it takes place. See [Section 6.2 "Maintaining Minimum Clock Speed"](#) for constraints on clock speed.

3.5 Serial Data Output (D_{OUT})

The SPI serial data output pin is used to shift out the results of the A/D conversion. Data will always change on the falling edge of each clock as the conversion takes place.

MCP3201

NOTES:

4.0 DEVICE OPERATION

The MCP3201 A/D Converter employs a conventional SAR architecture. With this architecture, a sample is acquired on an internal sample/hold capacitor for 1.5 clock cycles starting on the first rising edge of the serial clock after $\overline{CS}$ has been pulled low. Following this sample time, the input switch of the converter opens and the device uses the collected charge on the internal sample and hold capacitor to produce a serial 12-bit digital output code. Conversion rates of 100 ksp/s are possible on the MCP3201 device. See [Section 6.2 “Maintaining Minimum Clock Speed”](#) for information on minimum clock rates. Communication with the device is done using a 3-wire SPI-compatible interface.

4.1 Analog Inputs

The MCP3201 device provides a single pseudo-differential input. The $IN+$ input can range from $IN-$ to V_{REF} ($V_{REF} + IN-$). The $IN-$ input is limited to ± 100 mV from the V_{SS} rail. The $IN-$ input can be used to cancel small signal common-mode noise which is present on both the $IN+$ and $IN-$ inputs.

For the A/D Converter to meet specification, the charge holding capacitor (C_{SAMPLE}) must be given enough time to acquire a 12-bit accurate voltage level during the 1.5 clock cycle sampling period. The analog input model is shown in [Figure 4-1](#).

In this diagram, it is shown that the source impedance (R_S) adds to the internal sampling switch (R_{SS}) impedance, directly affecting the time that is required to charge the capacitor (C_{SAMPLE}). Consequently, a larger source impedance increases the offset, gain, and integral linearity errors of the conversion.

Ideally, the impedance of the signal source should be near zero. This is achievable with an operational amplifier such as the MCP601, which has a closed loop output impedance of tens of ohms. The adverse affects of higher source impedances are shown in [Figure 4-2](#).

If the voltage level of $IN+$ is equal to or less than $IN-$, the resultant code will be 000h. If the voltage at $IN+$ is equal to or greater than $\{V_{REF} + (IN-) - 1 \text{ LSB}\}$, then the output code will be FFFh. If the voltage level at $IN-$ is more than 1 LSB below V_{SS} , then the voltage level at the $IN+$ input will have to go below V_{SS} to see the 000h output code. Conversely, if $IN-$ is more than 1 LSB above V_{SS} , then the FFFh code will not be seen unless the $IN+$ input level goes above V_{REF} level.

4.2 Reference Input

The reference input (V_{REF}) determines the analog input voltage range and the LSB size, as shown below.

EQUATION 4-1:

$$LSB \text{ Size} = \frac{V_{REF}}{4096}$$

As the reference input is reduced, the LSB size is reduced accordingly. The theoretical digital output code produced by the A/D Converter is a function of the analog input signal and the reference input as shown below.

EQUATION 4-2:

$$Digital \text{ Output Code} = \frac{4096 * V_{IN}}{V_{REF}}$$

Where:

$$V_{IN} = \text{Analog Input Voltage} = V_{(IN+)} - V_{(IN-)}$$

$$V_{REF} = \text{Reference Voltage}$$

When using an external voltage reference device, the system designer should always refer to the manufacturer's recommendations for circuit layout. Any instability in the operation of the reference device will have a direct effect on the operation of the A/D Converter.

FIGURE 4-1: Analog Input Model.

FIGURE 4-2: Maximum Clock Frequency vs. Input Resistance (R_S) to maintain less than a 0.1 LSB deviation in INL from nominal conditions.

MCP3201

NOTES:

6.0 APPLICATIONS INFORMATION

6.1 Using the MCP3201 Device with Microcontroller SPI Ports

With most microcontroller SPI ports, it is required to clock out eight bits at a time. If this is the case, it will be necessary to provide more clocks than are required for the MCP3201. As an example, [Figure 6-1](#) and [Figure 6-2](#) show how the MCP3201 device can be interfaced to a microcontroller with a standard SPI port. Since the MCP3201 always clocks data out on the falling edge of clock, the MCU SPI port must be configured to match this operation. SPI Mode 0,0 (clock idles low) and SPI Mode 1,1 (clock idles high) are both compatible with the MCP3201. [Figure 6-1](#) depicts the operation shown in SPI Mode 0,0, which requires that the CLK from the microcontroller idles in the 'low' state. As shown in the diagram, the MSB is clocked out of the A/D Converter on the falling edge of the third clock pulse. After the first eight clocks have been sent to the

device, the microcontroller's receive buffer will contain two unknown bits (the output is at high-impedance for the first two clocks), the null bit and the highest order five bits of the conversion. After the second eight clocks have been sent to the device, the MCU receive register will contain the lowest-order seven bits and the B1 bit repeated as the A/D Converter has begun to shift out LSB first data with the extra clock. Typical procedure would then call for the lower-order byte of data to be shifted right by one bit to remove the extra B1 bit. The B7 bit is then transferred from the high-order byte to the lower-order byte, and then the higher-order byte is shifted one bit to the right as well. Easier manipulation of the converted data can be obtained by using this method.

[Figure 6-2](#) shows the same thing in SPI Mode 1,1 which requires that the clock idles in the high state. As with mode 0,0, the A/D Converter outputs data on the falling edge of the clock and the MCU latches data from the A/D Converter in on the rising edge of the clock.

FIGURE 6-1: SPI Communication using 8-bit segments (Mode 0,0: SCLK idles low).

FIGURE 6-2: SPI Communication using 8-bit segments (Mode 1,1: SCLK idles high).

6.2 Maintaining Minimum Clock Speed

When the MCP3201 initiates the sample period, charge is stored on the sample capacitor. When the sample period is complete, the device converts one bit for each clock that is received. It is important for the user to note that a slow clock rate will allow charge to bleed off the sample cap while the conversion is taking place. At 85°C (worst-case condition), the part will maintain proper charge on the sample capacitor for at least 1.2 ms after the sample period has ended. This means that the time between the end of the sample period and the time that all 12 data bits have been clocked out must not exceed 1.2 ms (effective clock frequency of 10 kHz). Failure to meet this criteria may induce linearity errors into the conversion outside the rated specifications. It should be noted that during the entire conversion cycle, the A/D Converter does not require a constant clock speed or duty cycle, as long as all timing specifications are met.

6.3 Buffering/Filtering the Analog Inputs

If the signal source for the A/D Converter is not a low-impedance source, it will have to be buffered or inaccurate conversion results may occur. See Figure 4-2. It is also recommended that a filter be used to eliminate any signals that may be aliased back into the conversion results. This is illustrated in Figure 6-3 where an op amp is used to drive the analog input of the MCP3201 device. This amplifier provides a low-impedance source for the converter input and a low-pass filter, which eliminates unwanted high-frequency noise.

Low-pass (anti-aliasing) filters can be designed using Microchip's interactive FilterLab® software. FilterLab will calculate capacitor and resistor values, as well as determine the number of poles that are required for the application. For more information on filtering signals, see application note AN699 "Anti-Aliasing Analog Filters for Data Acquisition Systems."

FIGURE 6-3: The MCP601 Operational Amplifier is used to implement a 2nd order anti-aliasing filter for the signal being converted by the MCP3201 device.

6.4 Layout Considerations

When laying out a printed circuit board for use with analog components, care should be taken to reduce noise wherever possible. A bypass capacitor should always be used with this device and should be placed as close as possible to the device pin. A bypass capacitor value of 1 μF is recommended.

Digital and analog traces should be separated as much as possible on the board and no traces should run underneath the device or the bypass capacitor. Extra precautions should be taken to keep traces with high-frequency signals (such as clock lines) as far as possible from analog traces.

Use of an analog ground plane is recommended in order to keep the ground potential the same for all devices on the board. Providing V_{DD} connections to devices in a “star” configuration can also reduce noise by eliminating current return paths and associated errors. See Figure 6-4. For more information on layout tips when using A/D Converter, refer to AN688 “Layout Tips for 12-Bit A/D Converter Applications”.

FIGURE 6-4: V_{DD} traces arranged in a ‘Star’ configuration in order to reduce errors caused by current return paths.

NOTES:

APPENDIX A: REVISION HISTORY

Revision F (August 2011)

- Updated **Product Identification System** section.
 - Corrected marking drawings for MSOP packages.
 - Updated PDIP, SOIC, and TSSOP package specification drawings.

Revision E (November 2008)

The following is the list of modifications:

1. Updated **Section 7.0 “Packaging Information”**.
2. Updated **Product Identification System** section.

Revision D (January 2007)

The following is the list of modifications:

1. This revision includes updates to the packaging diagrams.

Revision C (August 2001)

The following is the list of modifications:

1. This revision includes undocumented changes.

Revision B (August 1999)

The following is the list of modifications:

1. This revision includes undocumented changes.

Revision A (September 1998)

- Original release of this document.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2009 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
