**SuperLite™****DESCRIPTION**

The SY55852U is a flip-flop used to synchronize data to a clock. Its differential output will reproduce and remember the value on its input at the rising edge of the clock. In addition, an asynchronous, level sensitive reset is provided. For a synchronous reset, the SY55851U AnyGate® can be used.

SY55852U inputs can be terminated with a single resistor between the true and complement pins of a given input.

The SY55852U is a member of Micrel's SuperLite™ family of high-speed CML logic. This family features very small packaging and 2.3V to 5.7V operation.

**APPLICATIONS**

- High-speed logic
- OC-48 communication systems

## FUNCTIONAL DESCRIPTION

### Establishing Static Logic Inputs

The true pin of an input pair is internally biased to ground through a 75kΩ resistor. The complement pin of an input pair is internally biased halfway between  $V_{CC}$  and ground by a voltage divider consisting of two 75kΩ resistors. To keep an input at static logic zero at  $V_{CC} > 3.0V$ , leave both inputs unconnected. For  $V_{CC} \leq 3.0V$ , connect the

complement inputs to  $V_{CC}$  and leave the true inputs unconnected. To make an input static logic one, connect the true input to  $V_{CC}$ , leave the complement input unconnected. These are the only safe ways to cause inputs to be at a static value. In particular, no input pin should be directly connected to ground. All NC (no connect) pins should be unconnected.

**Note 1.** X is either D, CLK, R input. /X is either /D, /CLK, /R input.

**Notes:**

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS<sup>(1)</sup>

$V_{CC} = +2.3$ V to +5.7V; GND = 0V;  $T_A = -40$ °C to +85°C; unless otherwise noted.

$V_{CC}$	Power Supply Voltage		2.3		5.7	V
$I_{CC}$	Power Supply Current				36	mA

**Note:**

1. The device is guaranteed to meet the DC specifications, shown in the table above, after thermal equilibrium has been established. The device is tested in a socket such that transverse airflow of  $\geq 500$ lpm is maintained.

## CML DC ELECTRICAL CHARACTERISTICS<sup>(1)</sup>

$V_{CC} = +2.3$ V to +5.7V; GND = 0V;  $T_A = -40$ °C to +85°C; unless otherwise noted.

**Notes:**

1. Equilibrium temperature.
2. Inputs must be biased to logic LOW or HIGH when  $V_{CC}$  is less than 3.0V.
3. Actual voltage levels and differential swing will depend on customer termination scheme. Typically, a 400mV swing is available in the 100Ω environment and a 200mV swing in the 50Ω environment. Refer to the "CML Termination" diagram for more details.

**CML TERMINATION**

All inputs accept the output from any other member of this family. All outputs are source terminated 100Ω CML differential drivers as shown in Figures 3 and 4. SY55852U expects the inputs to be terminated, and that good high

speed design practices be adhered to. SY55852U inputs are designed to accept a termination resistor between the true and complement inputs of a differential pair. 0402 form factor chip resistors will fit with some trace fanout.
