32-bit Microcontroller Traveo™ Family

The Traveo family expands the company's automotive applications, scalability and high performance into one line-up and at the same time adds new features to fulfill the latest requirements of the automotive industry. Based on the powerful Arm® Cortex®- R5F core in single operations, it offers state-of-the-art real time performance, safety and security features. The family supports the latest in-car networks and offers high performance graphics engines optimized for a minimum memory footprint and embeds dedicated features to increase data security in the car.
S6J3310/20/30/40 is a microcontroller series for instrument clusters with small thin-film transistor (TFT) displays.

Features

- System
  - 32-bit Arm Cortex-R5F CPU core at up to 240 MHz
  - General purpose I/O port: up to 148
  - 12-bit A/D converter: up to 48 channels
  - External interrupt: up to 24 channels
  - Base timer: up to 32 channels
  - 32-bit reload timer: up to 6 channels
  - 32-bit free-run timer: 8 channels
  - Input capture unit: 12 channels
  - Output compare unit: 12 channels
  - Stepper motor controller (SMC): 6 Units
  - Built-in CR oscillator
  - Real-time clock
  - DMA controller: 16 channels
  - JTAG debug interface
- Graphics and Display (optional)
  - 2D graphic engine
  - RGB888
  - LCD : up to 4 COM x 32 SEG
- Communication
  - CAN-FD: up to 6 channels
  - Multi-function serial interface: up to 12 channels, selectable protocol: UART, CSIO, LIN and I^2C
  - Ethernet AVB MAC (optional)
  - MediaLB (optional)
  - Automotive Remote Handler for APIX® (optional)
- Memory
  - HyperBus™ Memory interface
  - DDR High Speed SPI
  - External BUS interface
- Multimedia (optional)
  - I2S input/output: 2 channels
  - PCM to PWM output unit
  - Sound mixer: 1 unit x 10 inputs
  - Stereo audio DAC
- Security and Safety
  - Secure Hardware Extension – SHE
  - Safety features, such as MPU, TPU, ECC and others
  - CRC generator: 1 channel
  - Watchdog timer with window function
  - Low voltage detector
  - Clock supervisor for all source clocks

Applications

- Instrument cluster

3. Product Description

3.1 Overview

This chapter explains the product features of S6J3310/20/30/40 series. The description of this chapter should precede the duplicated description on *Traveo™ Platform Hardware Manual*.

3.2 Product Description

The table shows features.

Table 3-1: Product Features

Feature	Description
Technology	40-nm CMOS technology with embedded FLASH Fully automotive qualified according to ISO/TS 16949 and AEC-Q100 Developed according to ISO26262, safety target ASIL-B
Functional Safety	The product series has some functional safety features suited for ASIL-B application.
Peripherals	See function list.
Power Domain (PD)	See the *Traveo™ Platform Hardware Manual* and chapter STATE TRANSITION in detail. The product series supports the power off control of PD1, PD2 (including PD3 and 5), PD4_0, PD4_1 and PD6. The power domain resets of PD3 and PD5 included in PD2 are not supported in the product series, and "0" is always read from the reset factor flags of them. This series doesn't support partial wakeup for PD6.
Debug and Trace	See the *Traveo™ Platform Hardware Manual* in detail. – Standard 5-pin JTAG interface – 4 kB Embedded Trace Buffer 4-bit trace support for TEQFP package.
System Control	See the *Traveo™ Platform Hardware Manual* in detail. Main and sub oscillator is available. – A wide range of 3.6 - 16MHz is available for main oscillator – 32KHz is available for sub oscillator Sub clock is enable/disable by register settings
Clock	See the *Traveo™ Platform Hardware Manual* in detail. CLK_CLKO (Clock Output Function) is supported. Main Oscillation Stabilization Wait Time (at 4 MHz):8.19ms (Initial value)
Embedded CR oscillation	See the *Traveo™ Platform Hardware Manual* in detail. Stabilization time is as followings. − 0.35 ms to 0.8 ms for 4 MHz (Fast clock) − 0.43 ms to 1.28 ms for 100 kHz (Slow clock)
Clock Supervisor	See the *Traveo™ Platform Hardware Manual* in detail. This product series doesn’t support clock supervisor output port. (Related register and internal circuit is implemented.)
Reset	RSTX pin + MD pin simultaneous assert INITX (Same as INITX pin input) – Occurrence factor: Simultaneously inputting “L” level to RSTX pin and inputting “L” level to MD pin – Release factor: Inputting “H” level to RSTX pin See the *Traveo™ Platform Hardware Manual* in detail. Following resets are not mounted on this device. – SRSTX (and nSRST pin) The product series does not support EX5VRST and writing EX5VRSTCNT bits in SYSC0_SPECFGR has no effect.

Feature	Description
Hardware watchdog	See the *Traveo™ Platform Hardware Manual* in detail. Hardware watchdog function stops during PSS mode. In the related register of HWDG_CFG, the bit ALLOWSTOPCLK is always read as 1 (HWDG_CFG.ALLOWSTOPCLK = 1). The product series doesn't support Watchdog Counter Monitor Output port. (Related register and internal circuit is implemented.)
Standby mode	See the *Traveo™ Platform Hardware Manual* in detail. Standby mode with 5 V (or 3 V) single external power supply is available. Turning off the 1.2 V external power supply in standby mode is available. The long term pulse of the indicator PWM can be outputted during RTC Standby mode.
PLL / SSCG PLL	See the *Traveo™ Platform Hardware Manual* in detail. Use case assumption is following. PLL – Sound system clock – Sound frequency master clock – Peripherals – Display clock – Trace clock SSCG – CPU core – GDC core – Hyper BUS – DDR-HSSPI Product supports down spread and center spread modes with the conditions defined in 9.1.4.3 Internal Clock Timing (S6J3310).
External Interrupts	See the *Traveo™ Platform Hardware Manual* in detail.
NMI	See the *Traveo™ Platform Hardware Manual* in detail. 1 NMI pin.
Memory Protection	MPU16 AHB: See the *Traveo™ Platform Hardware Manual* in detail. MPU for AXI: ch.0 MPU for AHB: ch.1 Additional MPU for Graphic sub system, MediaLB and Ethernet AVB. They are described on the chapter of MPU for AHB and MPU for AXI To configure Lock or Unlock for both MPUXn_UNLOCK and MPUHn_UNLOCK, − Lock: 0x112ABB56 − Unlock: 0xACCABB56
Peripheral Protection	See the *Traveo™ Platform Hardware Manual* in detail. Protected peripherals are described in the base address map.
Internal Memories System SRAM	384 KByte 1 wait cycle is necessary for RAM read at over 120MHz.
Internal Memories TCRAM	128 KByte
Internal Memories Backup RAM	32 KByte Backup RAM can only be operated in RUN mode (normal operation mode). In other mode the memory content should be retained, but it cannot be operated. SLEEP control for Backup RAM is not supported and cannot be used.

Feature	Description
Embedded Program/Work Flash Memory	Embedded Program Flash can be accessed with 0-wait-cycle if CPU frequency is 80MHz or less. 0-wait-cycle: 80MHz or less. 1-wait-cycle: 160MHz or less. 2-wait-cycle: more than 160MHz. Work Flash can be accessed with 0-wait-cycle if CPU frequency is 12.5MHz or less. 6-wait-cycle: 80MHz or less. 12-wait-cycle: 160MHz or less. The wait-cycle setting see the *Traveo™ Platform Hardware Manual* in details. The CLK_FCLK maximum frequency should be referred in 9.1.4.3. Erase suspend is supported. Reading and writing to the other sector are possible when Flash Erase is suspended. Serial Flash programing and Parallel Flash programing are supported. Margin mode is not supported.
Internal Power Domain	PD1: Always ON PD2: Cortex R5F platform/ GDC/ additional peripherals PD4: Backup RAM in Always On domain PD6: Peripherals in Always On domain * The chapter of the block diagram explains in detail.
Power Supply	5 V, and 3 V, 1.2 V external power supply is required. Built in LDO provides internal power supply for Always On region (PD1). 1.2 V external power supply control pin is supported. 3 V external power supply could be controlled by GPIO. There are constraints of power on/off sequence.
Low Voltage Detection	LVD for external voltage is supported. LVD for internal voltage is supported. See 9.1.4.11 and 9.1.4.12.
Low voltage detection for RAM retention (RVD)	RVD for RAM retention is effective during the standby mode only. That is, it is only for the Backup RAM of 32KB that the function is available.
Resource inter-connect	The output signal of some resources can be inputted to the other resource.
I/O Ports	5 V general purpose I/O 3 V general purpose I/O Multi input level and multi output drivability Pull-up, pull-down function is available. Resource input and output is multiplexed. +B input is allowed many pins of 3.3 V, 5 V and 3.3 V/5 V I/O domain.
A/D Converter	12 bit resolution, 2 unit (Unit0 is possible to select channels 4-31. Unit1 is possible to select channels 32-63.) 48 channels of analog input for TEQFP208 48 channels of analog input for TEQFP176 35 channel of analog input for TEQFP144 24 channels of them are shared with the SMC for TEQFP208/176/144 External trigger and timer trigger are available. The description of the A/D converter function should be referred in the *S6J3300 Hardware Manual*. Though the chapter of I/O port in *Traveo™ Platform Hardware Manual* describes another A/D converter function, do not refer it. A/D Channel Control Register (ADC12Bn_CHCTRL0) [bit5:0] ANIN[5:0]: Analog Input Selection bits. This register setting is possible of channel 0-31 (the register value is 00_0000 to 01_1111). AN39 to AN63 are not support for S6J33xxxAx, S6J33xxxCx, S6J33xxxEx, and S6J33xxxGx option.
CRC	See the *Traveo™ Platform Hardware Manual* in detail.

Feature	Description
Programmable CRC	DMA support
Sound Generator	Produces sound/melody with varying frequency and amplitude for convenient duration Square wave sound output Automatic linear amplitude increment or decrement Interrupt request generated when specified sound length has ended
Sound Waveform generator	Sine waveform, saw-tooth waveform and Square waveform are generated with easy configuration of the parameters which specified sound sources. Fade-in and Fade-out control for reverberation.
Sound Mixer	The input channels of 0 - 4 are reserved for waveform generator. Mixing different sampling frequency sounds. Mixing Internal sounds and External I2S input sounds. Saturating addition function for keeping sound quality. Cut a specific frequency data by digital filter. LPF is support by FIR filter. Fade-in and Fade-out control.
PCM-PWM	Conversion of PCM audio streaming to Pulse Width Modulated signals. Supports 2 output channels for stereo and mono data Up to 16-bit output sample resolution Support for half and full H-bridges
Audio DAC	The sound source of the fixed 48 kHz sampling frequency can be outputted. 1 unit, L/R channels support. BTL connection is available.
I2S	2 ch. – I2S0 only supports the output of sound sources. – I2S1 supports both the input and the output.
Base Timer	See the *Traveo™ Platform Hardware Manual* in detail. A unit consists of a pair of 16-bit base timers. 16 units, that is, 32 channels of base timers are available.
Reload Timer	See the *Traveo™ Platform Hardware Manual* in detail.
I/O Timer	See the *Traveo™ Platform Hardware Manual* in detail.
Up/Down Counter	See the *Traveo™ Platform Hardware Manual* in detail.
Multi-Functional Serial (MFS)	See the *Traveo™ Platform Hardware Manual* in detail. Only 2 ports of MFS have the dedicated I/O for I^2C. See I^2C timing in 9.1.4.6 Multi-Function Serial in detail. The I^2C is not designed to be hot swappable. CTS/RTS is not mounted (hardware flow control is not supported for this series.)
CAN-FD	Flexible data rate is supported. 16 KB/ch of message RAM is available. The clock output from CAN pre-scaler is supplied to every CAN. ECC error generation function of the message RAM is not supported for this device. Therefore CAN FD ECC Error Insertion Control Register (FDFECR) is not writeable.
Real Time Clock (RTC) with auto-calibration	See the *Traveo™ Platform Hardware Manual* in detail.
DDR High Speed SPI	ch.0: HSSPI as a MCU peripheral
Hyper BUS I/F	ch.0: Hyper Bus as a MCU peripheral The following register is not supported and cannot be used. – Controller Status Register (HYPERBUSIn_CSR) – Interrupt Enable Register (HYPERBUSIn_IEN) – Interrupt Status Register (HYPERBUSIn_ISR) – Write Protection Register (HYPERBUSIn_WPR) – Test Register (HYPERBUSIn_TEST) GPO signal can only be used for "Internal Control example by GPO" in this product, that is, it can select using HyperBus of PF or using HyperBus of Graphic Sub System.

Feature	Description
Stepper Motor Control (SMC)	Each channel has 6 motor drivers with high output capability
External Interrupt Capture Unit (EICU)	See the *Traveo™ Platform Hardware Manual* in detail.
Ethernet AVB	10/100 Mbps MII-Interface Supports Audio-Video Bridging (AVB)
MediaLB	MOST50 (1024FS) 3 wires Maximum 15 ch is available.
LCD Controller	TEQFP208: 4 com x 32 seg TEQFP176: 4 com x 32 seg TEQFP144: 4 com x 24 seg LCDC pins are initialized with Reset. (Stop LCDC alternating current output) Duty and Static of segment output is supported. (SEG23/ST0, SEG24/ST1, SEG25/ST2, SEG26/ST3, SEG27/ST4, SEG28/ST5, SEG29/ST6, SEG30/ST7, SEG31/ST8)
SHE	See the *Traveo™ Platform Hardware Manual* in detail.
Source Clock Timer	See the *Traveo™ Platform Hardware Manual* in detail.
Graphics Subsystem	80 MHz maximum clock frequency Variable setting about GDC clock. (Asynchronous with CPU clock) 480 x 272 pixels maximum frame resolution Video modes up to 25 MHz pixel clock RGB888, Order replacement of RGB pins.
External BUS	TEQFP208: 22 bit address and 16 bit data TEQFP176: 22 bit address and 16 bit data TEQFP144: 15 bit address and 8 bit data
ARH	2 ch This device does not have PHY macro and its function.
Power Supply Control (PSC)	PSC (PSC_1) output is used for external 1.2 V power supply module control and automatically switched with the following condition. "High": Request to supply VCC12 - "Power ON Reset" is released - CPU wakes up from PSS shutdown mode "Low": Request to stop supplying VCC12 - CPU transfers from RUN mode to PSS shutdown mode. For timing chart of output signals include PSC in detail, see the "*S6J3300 Hardware Manual*" and chapter "State Transition"

3.2.1 Ethernet

The following functions are not supported.

Functions	Remarks
External FIFO Interface	
Additional Low Latency TX FIFO Interface for DMA configurations	
MAC Transmit Block - half-duplex - collision - back_pressure	
MAC Filtering Block - external address match - Wakeup On Lan	
Energy Efficient Ethernet support	
LPI Operation in Cadence IP	
PHY Interface - GMII - SGMII - TBI	
10/100/1000 Operation - 1000 M	
SGMII Operation	
Jumbo Frames	
Physical Control Sub-Layer

NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
3. DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
4. TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
6. DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
7. REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
8. DIMENSION b DOES NOT INCLUDE DAMBER PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
9. EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
10. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
11. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

5. IO Circuit Type

5.1 I/O Circuit Type

This section explains I/O circuit types.

Type	Circuit	Remarks
A		– Analog output (3 V) – Audio DAC output
B		– General-purpose I/O port – Output 2 mA, 5 mA, 6 mA or 15 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – TTL input
C		– General-purpose I/O port – Output 2 mA, 5 mA, 6 mA or 15 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – MediaLB level hysteresis input
D		– External 1.2 V regulator control – Output 2 mA
E		– General-purpose I/O port – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input

Type	Circuit	Remarks
G		– General-purpose I/O port with analog input – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input
H		– General-purpose I/O port with analog input – Output 1 mA, 2 mA, 3 mA (I^2C) or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input
I		– 50 kΩ with pull-up – CMOS hysteresis input
K		– Main oscillation I/O
L		– JTAG_NTRST – 50 kΩ with pull-down – TTL input

Type	Circuit	Remarks
L2		– JTAG_TDI/TMS/TCK – 50 kΩ with pull-up – TTL input
M		– JTAG_TDO – Output 5 mA
N		– RSTX input – 50 kΩ with pull-up – CMOS hysteresis input
O		– CMOS hysteresis input
P		– General-purpose I/O port with analog input – Output 1 mA, 2 mA, 5 mA or 30 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input
Q		– General-purpose I/O port – Output 1 mA, 2 mA, 5 mA or 30 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input

Type	Circuit	Remarks
R		– Sub oscillation I/O shared General-purpose I/O port – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input
S		– General-purpose I/O port with LCDC COM/SEG output – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input

Type	Circuit	Remarks
S2		– General-purpose I/O port with LCDC COM/SEG output – Output 1 mA, 2 mA, 5 mA or 15 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input
T		– General-purpose I/O port – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input
U		– General-purpose input port with LCDC reference voltage input – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input

Type	Circuit	Remarks
V		– General-purpose I/O port with LCDC reference voltage input – Output 1 mA, 2 mA or 5 mA selectable – 50 kΩ with pull-up resistor control – 50 kΩ with pull-down resistor control – CMOS hysteresis input – Automotive hysteresis input – TTL input

6.2 Remark

Notes:

- *The port description list shows the port function of description which is mounted and supported on the product. The function which is not described in this table is not supported and assured.*
- *See the function list of the product as well.*

7. Port Configuration

7.1 Resource Input Configuration Module

The resource input configuration module (RIC) is a function to select input from an external or output from another internal resource as resource input. A resource which supports either a port input relocation or a resource inputs from the other resource has its RIC_RESIN register to configure resource input configuration. The Resource which are available through only one port does not have the multiplexer implemented i.e. No RIC_RESIN register.

Notes:

- *When both GPIO_PORTEN.GPORTEN and PPC_PCFGR.PIE are configured as 0, the input signal is disconnected and external interrupt cannot be detected. During disconnecting, I/O internally outputs "low" to internal logic, and if ELVR is configured as low-level-detection, falling-edge-detection, or both-edge-detection it will be detected as external interrupt with EIRR = 1.*
- *"Set 0" (Set 1) means that "0" ("1") is inputted.*
- *OCUx_MODn is described as MODn pin in Traveo™ Platform Hardware Manual.*

7.2 Port Output Function Configuration

The port output function configuration (POF) is a function to select a function to output to a port.

A resource which supports a port output relocation has its PPC_PCFGR.POF to configure resource output.

8. Precautions and Handling Devices

8.1 Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

8.1.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, and so on.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

8.1.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

(1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.

(2) Use dry boxes for product storage. Products should be stored below 70 % relative humidity, and at temperatures between 5 ˚C and 30 ˚C. When you open Dry Package that recommends humidity 40 % to 70 % relative humidity.

(3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.

(4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 ˚C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

(1) Maintain relative humidity in the working environment between 40 % and 70 %.
Use of an apparatus for ion generation may be needed to remove electricity.

(2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.

(3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.

(4) Ground all fixtures and instruments, or protect with anti-static measures.

(5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

8.1.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

8.2 Handling Devices

For Latch-Up Prevention

The latch-up phenomenon may occur on a CMOS IC in the following cases: the voltage applied to an input or output pin is higher than VCC or lower than VSS; or the voltage applied between a VCC pin and a VSS pin exceeds the rating. A latch-up causes a rapid increase in the power supply current, possibly resulting in thermal damage to an element. When using the device, take sufficient care not to exceed the maximum rating.

Also be careful that analog power supplies (AVCC5,AVRH5) and analog inputs do not exceed the digital power supply (VCC) at the analog system power-on and power-off times.
The power-on sequence is as follows. Simultaneously turn on the digital supply voltage (VCC) and analog supply voltages (AVCC5,AVRH5), or turn on the digital supply voltage (VCC) and then the analog supply voltages (AVCC5,AVRH5).

About Handling Unused Pins

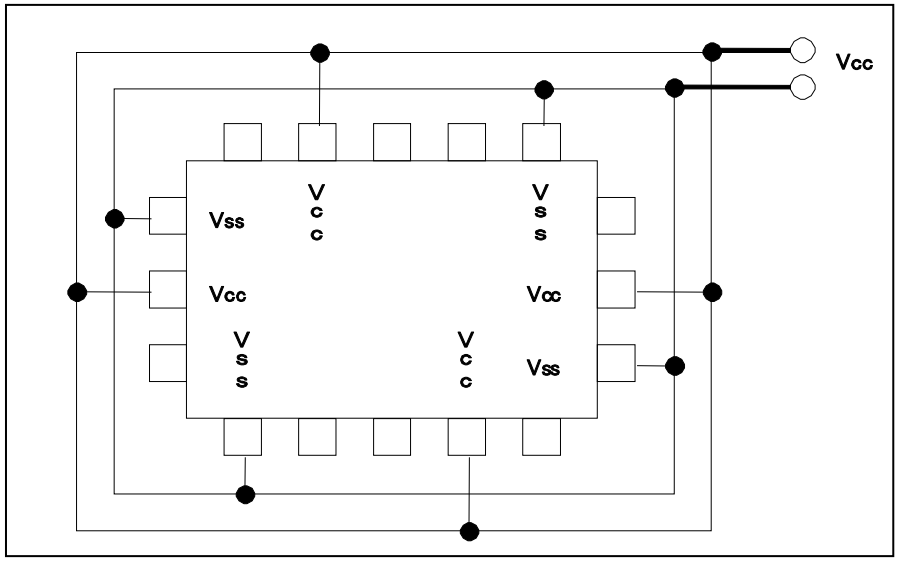
Leaving unused input pins open may cause permanent damage from a malfunction or latch-up. Take measures for unused pins, such as pulling up or pulling down the voltage with resistors of 2 kilo ohms or higher.

If there are any unused input/output pins, set them to the output state and then open them, or set them to the input state and handle them in the same way as input pins.

About Power Supply Pins

If the device has multiple VCC and VSS pins, the device is designed in such a way that the pins that should be at the same potential are connected to each other inside the device to prevent malfunctions such as latch-up. However, to reduce unwanted emissions, prevent malfunctions of strobe signals caused by an increase of the ground level, and observe standards on total output current, be sure to connect all the VCC and VSS pins to the power source and ground externally. Also handle all the VSS power supply pins in this way as shown in the following diagram. If there are multiple VCC or VSS systems, the device does not operate normally even within the guaranteed operating range.

Figure 8-1 Pin Assignment



In addition, consider connecting with low impedance from the power supply source to the VCC and VSS of this device.

We recommend connecting a ceramic capacitor as a bypass capacitor between VCC and VSS, near this device.

About the Crystal Oscillation Circuit

Noise entering the X0 or X1 pin may cause a malfunction. Design the printed circuit board in such a way that the X0 and X1 pins, the crystal oscillator (or ceramic resonator), and a bypass capacitor to ground are located very close to the device.

We recommend that the printed circuit board artwork have the X0 and X1 pins enclosed by ground.

About the Mode Pin (MODE)

Use mode pin MODE by directly connecting it to a VCC or VSS pin. To prevent noise from causing the device to accidentally enter test mode, reduce the pattern length between each mode pin and a VCC or VSS pin on the printed circuit board, and connect them with low impedance.

About the Power-on Time

To prevent the internal built-in voltage step-down circuit from malfunctioning, secure a voltage rising time of 50 µs (between 0.2 V and 2.7 V) or longer at the power-on time.

Point to Note during PLL Clock Operation

While a PLL clock is selected, if the oscillator breaks off or input stops, the PLL clock may continue operating with the free running frequency of the internal self-oscillator circuit. This operation is outside of the guaranteed range.

Power Supply Pin Processing of an A/D Converter

Even when no A/D converter is used, establish a connection such that AVCC5 = AVRH5 = VCC5 and AVSS/AVRL5 = VSS.

Points to Note About Using External Clocks

External clocks are not supported.

External direct clock input cannot be used.

Power-on Sequence of the Power Supply Analog Inputs of an A/D Converter

Be sure to turn on the digital power supply (VCC) before the application of the power supplies (AVCC, AVRH, and AVRL) and analog inputs (AN0 to AN63) of an A/D converter.
At the power-off time, turn off the power supplies and analog inputs of the A/D converter, and then turn off the digital power supply (VCC). Perform these power-on and power-off operations without AVRH exceeding AVCC. Even when using a pin shared with an analog input as an input port, do not allow the input voltage to exceed AVCC. (Turning on or off the analog supply voltage and digital supply voltage simultaneously is not a problem.)

Method to Switch Off VCC12 during Power-Off Sequence

During power-off sequence, it is necessary to switch off VCC12 by driving PSC1 pin low by entering PSS mode (power domain 2 off). If VCC12 needs to be switched off by other means, RSTX needs to be asserted before switching off VCC12 to inactivate the operation of VCC12 supplied domain below the operation assurance range.

About C Pin Processing

This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet.

Precautions on Designing a Mounting Substrate

Measures against heat generation from the package must be taken for the mounting substrate to observe the absolute maximum rating (operating temperature). Design a mounting substrate with 4 or more layers. Connect the back of the package stage and the substrate pad with solder paste. Arrange thermal via holes on the substrate pad.

Notes on Writing to a Register Containing a Status Flag

In writing to a register containing a status flag (particularly an interrupt request flag, etc.) to control a function, it is important to take care not to accidentally clear the status flag.
Therefore, before the write operation, configure the status bit such that the flag is not cleared, and then set the control bit to the desired value.
Especially for control bits configured as a set of multiple bits, bit instructions cannot be used (bit instructions have only 1-bit access). In such cases, byte, half-word, or word access is used to write to the control bits and a status flag simultaneously. However, at this time, be careful not to accidentally clear bits other than the intended ones (the status flag bit in this case).

Note: Bit instructions take this point into account for registers that support bit-band units, so it does not need to be a concern. You need to take care when using bit instructions for registers that do not support bit-band units.

*9 Output of 3 V pins.

*10 Output of I^2C.

*11 Output of Media LB pins

*12 Output of DSP0_CLK pins

*13 VI or VO should never exceed the specified ratings. However, if the maximum current to/from an input is limited by a suitable external resistor, the ICLAMP rating supersedes the VI rating.

*A Relevant pins: All general-purpose ports and analog input pins

- Corresponding pins: all general-purpose ports
- Use within recommended operating conditions.
- Use at DC voltage (current).
- The +B signal should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the VCC pin via a protective diode, possibly affecting other devices.
- Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave + B input pins open.

Current and Power Dissipation

U_reverse = -28 V
R_serial = 22 k
=> I_pin = 1.3 mA

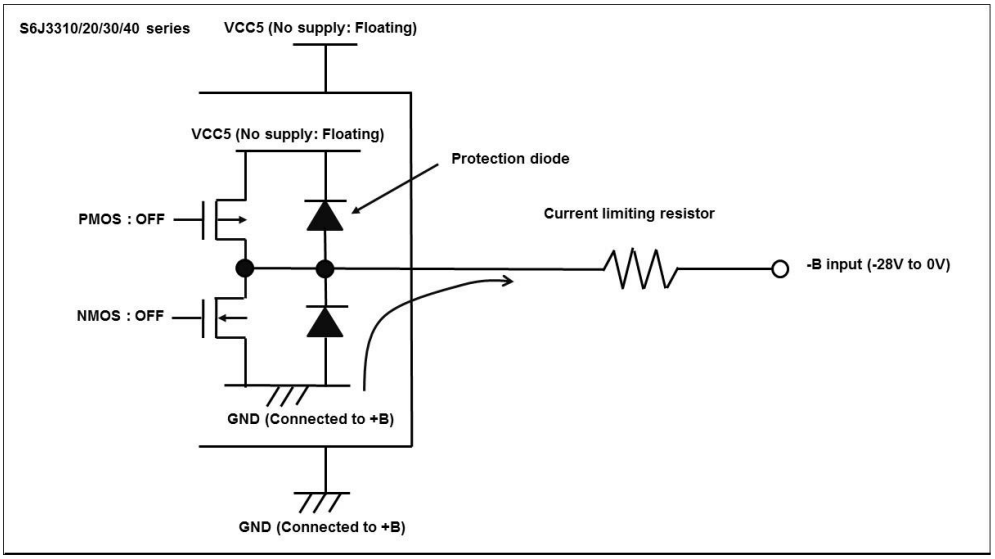
U_out = -0.7 V (current drawn mainly over clamping diodes)

=> I_total = 50 pins x 1.3 mA = 65 mA
=> P_total = 50 pins x (1.3 mA x 0.7 V) = 46 mW

I_total and P_total are within allowed limits of extended specification.

- The - B signal should always be applied by connecting a limiting resistor between the - B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the - B signal is input.
- Do not leave - B input pins open.

Example of a recommended circuit



WARNING:

– *Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.*

*4:Corresponding functions for Low voltage monitoring of supply voltage are described in CHAPTER 13 Low Voltage Detection of *S6J3300 Series Hardware Manual*.

The detection/release threshold values of following LVD channels are potentially below supply range defined in 9.1.2 Recommended operating condition (refer to "9.1.4.11 Low Voltage Detection (External Voltage)" and “9.1.4.12 Low Voltage Detection (Internal Voltage)" for detection/release threshold values for these LVD channels):

LVDL0

LVDL1

LVDL2

LVDH0

LVDH1

LVDH2

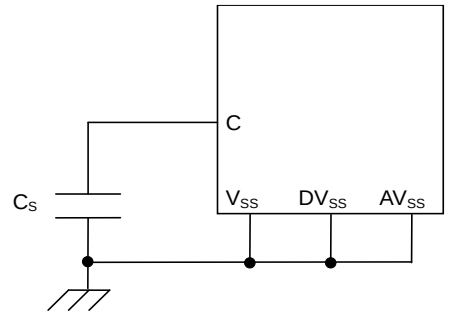
When it is used outside recommended range (this is the range of guaranteed operation), contact your sales representative. The initial detection voltage of the external low voltage detection is 2.6 V ± 3.5 %[*2] [*3] (LVDH1/LVDH2) or 0.8 V ± 3.5 % (LVDL2). This LVD setting and internal LVD (LVDL0/LVDL1) cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage.

- Please use these LVD channels with your own risk
- Please monitor the external power supplies on the PCB if needed

*5:When the voltage of Vcc12 is in the out of range against supply voltage operation assurance, the operation of circuit which Vcc12 used as the power source becomes unstable status. In that case, the value of each registers including RESCAUSEUR Register cannot be guaranteed, so these flags should don't care by software processing

*: For the connections of smoothing capacitor C_S, see the following diagram.

C Pin Connection Diagram



Notes:

- *The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the electrical characteristics of the device are warranted when the device is operated within these ranges.*
  Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact sales representatives beforehand.
- *Required power supply sequence is the following:*
  {VCC5 -> AVCC5} -> [DVCC or VCC53 or VCC3 or AVCC3_DAC or VCC12]
  Note that power supplies inside "[ ]" can be turned on in arbitrary order and "{ }" can be turned on in shown sequence or simultaneously.

Notes:

- *T_A: Ambient temperature (JEDEC)*
- *T_C: Case temperature (JEDEC), the maximum measured temperature of package case top.*
- *Both rating of T_A and T_C should simultaneously be satisfied as maximum operation temperature.*
- *The following condition should be satisfied in order to facilitate heat dissipation.*
    1. *Four or more layers PCB should be used.*
    2. *The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard)*
    3. *One layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90 % or more. The layer can be used for system ground.*
    4. *35 % or more of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer.*
    5. *The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.*

Example thermal via holes on PCB

- *The above figure is a schematic diagram showing PCB in section.*
- *Thermal via holes should closely be placed and aligned with lands.*
- *It is recommended to connect the land pattern to the VSS-ground level (GND plan of inner layer bellow the MCU) as thermal heat sink.*

*1: Target maximum clock frequencies when CPU clock = 240MHz

*2: Target maximum clock frequencies when CPU clock = 200MHz

*3: Target maximum clock frequencies when CPU clock = 180MHz

*4: The PLLx/SSCGx cannot set under 200MHz.

- Note that Ta = 125 condition is not supported in this product type.

When using SSCG_PLL output for these internal clock, the MAX value of frequency has the following restrictions.

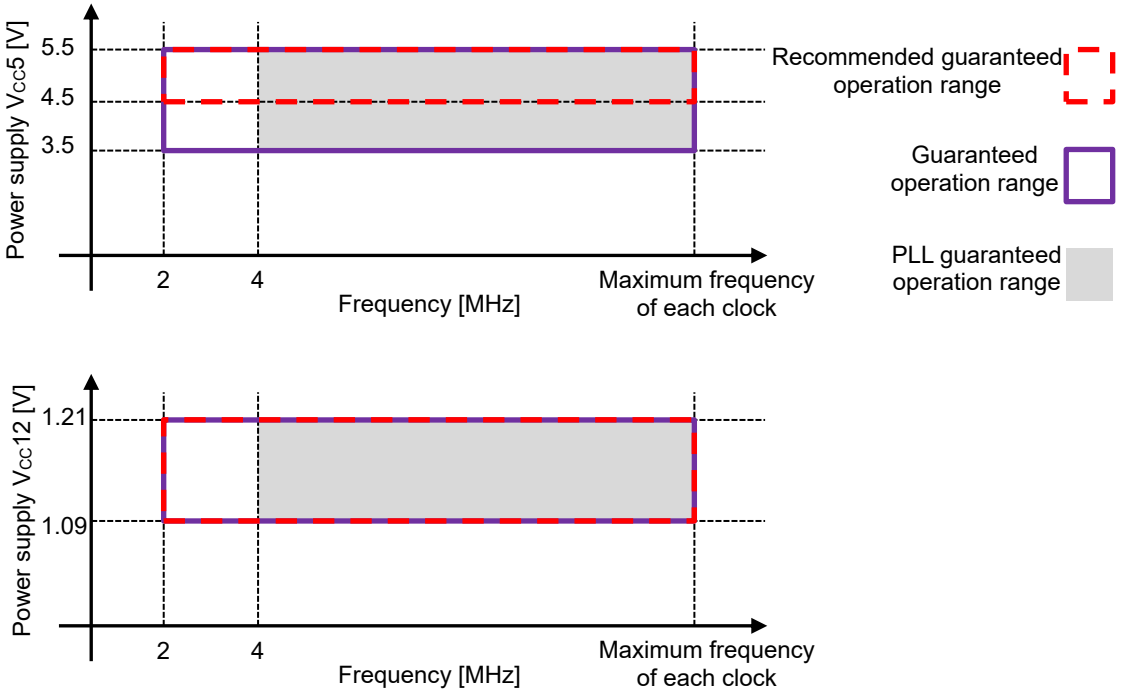
- On the presumption that the modulation mode of SSCG_PLL is used with down spread,

the MAX value of the frequency is standardized.

- This means that MAX value of frequency is the maximum value when SSCG_PLL was modulated.
- "Unused" means a clock source which doesn't have any supply destinations. Configure it as disable with performing at the lower clock frequency than the described maximum.

- Operation assurance range

Relationship between the internal clock frequency and supply voltage



Note: CPU will be reset, when the power supply voltage is equal to or less than LVD setting voltage.

- Relationship between the oscillation clock frequency and internal clock frequency

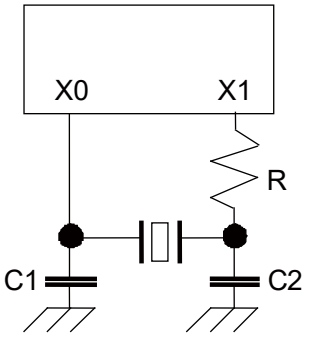
- Oscillation circuit example

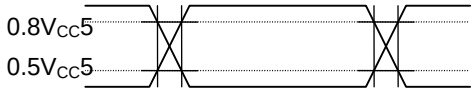


Note:
For the configuration of an oscillation circuit, request the oscillator manufacturer to perform a circuit matching evaluation before starting design.

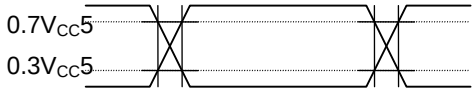
AC characteristics are specified by the following measurement reference voltage values.

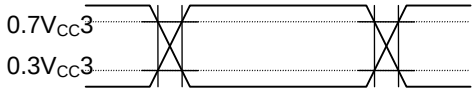
- Input signal waveform

Hysteresis input pin (Automotive)

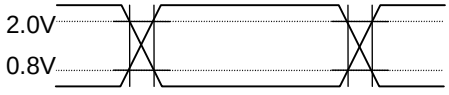


Hysteresis input pin (CMOS Schmitt)





Hysteresis input pin (TTL)



- Output signal waveform

Maximum ramp rate guaranteed to not generate power-on reset	|dV/dt|	VCC5	VCC5: Between 2.4 V and 4.5 V	-	-	50	mV/µs	*4

*1: This specification is at 1 V/µs of power ramp rate.

*2: VCC5 must be held below 1.5 V for a minimum period of t_{OFF}.

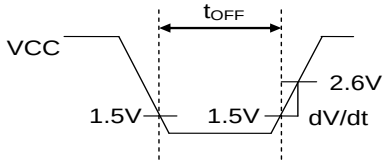
*3: Power ramp rate must be 1 V/us or less from 1.5 V to 2.6 V.
Power-on can detect by satisfying power ramp rate when power off time is satisfied.

*4: This specification is specified the power supply fluctuation after power on detection. When VCC5 voltage is between 2.4 V and 4.5 V, the power supply fluctuation is below 50 mV/us, the detection of power-on is suppressed. The power-on does not detect in any power fluctuation between 4.5 V and 5.5 V.

Notes:

When using S6J3310/20/30/40, *2 and *3 must be satisfied. When neither *2 nor *3 can be satisfied, assert external reset (RSTX) at power up and any brownout event.

- **Power off time, Power ramp rate**



- **Maximum ramp rate guaranteed to not generate power-on reset**

*1: If the fluctuation of the power supply is faster than the low-voltage detection time, there is a possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

*2: Please suppress the change of the power supply within the range of the power-supply voltage regulation to do a low-voltage detection by detecting voltage (VDL)

*3: For S6J33xxxSx or S6J33xxxUx or S6J33xxxTx or S6J33xxxVx option.

*4: For S6J33xxxAx or S6J33xxxBx or S6J33xxxCx or S6J33xxxDx or S6J33xxxEx or S6J33xxxFx or S6J33xxxGx or S6J33xxxHx option.

*5: These LVD settings cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage (2.7 V).

Notes:

- *The detection/release threshold values of following LVD channels are potentially below supply range defined in 9.1.2 Recommended Operating Condition.*
  LVDH1 (VCC5)
  LVDH2 (VCC3)
- *Please use these LVD channels with your own risk.*
- *Please monitor the external power supplies on the PCB if needed.*
- *For S6J33xxxSC or S6J33xxxUC or S6J33xxxTC or S6J33xxxVC options:*
  Depending on the threshold setting, LVDH1 can always detect VCC5 low voltage before the supply drops below the level defined in 9.1.2 Recommended Operating Condition. Please refer to S6J3300 series Hardware Manual for available list of LVDH1 threshold settings.

*1: If division-ratio is even value, dH is equivalent to 0.5.

Otherwise, dH is calculated as the following.

dH = The number rounding "division-ratio x 0.5" down to the nearest integer / division-ratio

division-ratio is multiplication value among SYSDIV bit, HPMDIV bit and EXTBUSDIV bit setting.

ex). Setting SYSDIV to 1-division, HPMDIV to 7-division, EXTBUSDIV to 1-division, dH is calculated as 0.429.

*2: If division-ratio is even value, dL is equivalent to 0.5.

Otherwise, dL is calculated as the following.

dL = The number rounding "division-ratio x 0.5" up to the nearest integer / division-ratio

division-ratio is multiplication value among SYSDIV bit, HPMDIV bit and EXTBUSDIV bit setting.

ex). Setting SYSDIV to 1-division, HPMDIV to 7-division, EXTBUSDIV to 1-division, dL is calculated as 0.571.

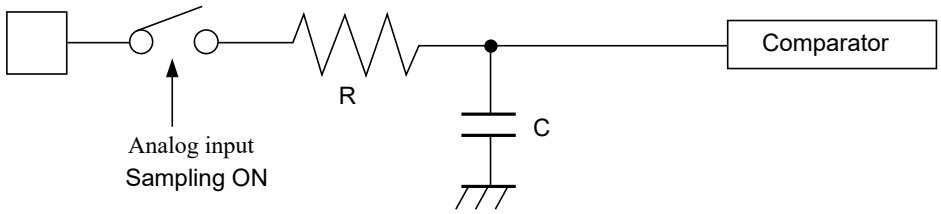
9.1.5.2 Notes on A/D Converters

About the Output Impedance of an External Circuit for Analog Input

When the external impedance is too high, the analog voltage sampling time may become insufficient. In this case, we recommend attaching a capacitor (about 0.1 µF) to an analog input pin.

Analog input circuit model



R	C		
12-bit A/D	3.9 kiloohms (max)	11.0 pF (max)	(4.5 V ≤ $AV_{CC}5$ ≤ 5.5 V)

Note: Use the numerical values provided here simply as a guide.

9.1.5.3 Glossary

Resolution: Analog change that can be identified by an A/D converter

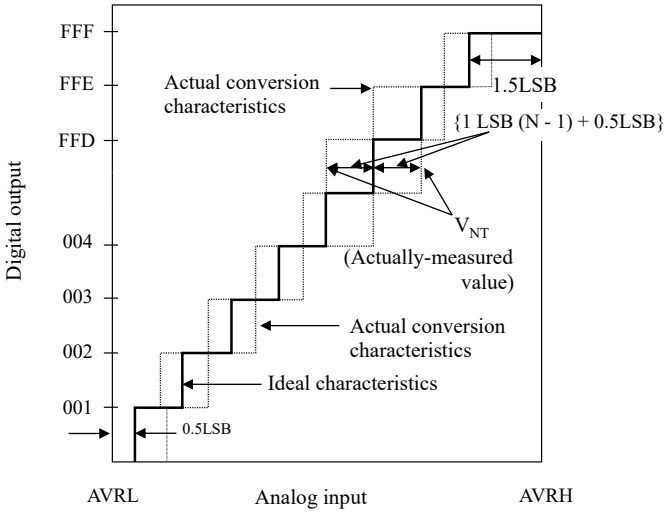
Integral linearity error: Deviation of the straight line connecting the zero transition point ("0000 0000 0000" <--> "0000 0000 0001") and full-scale transition point ("1111 1111 1110" <--> "1111 1111 1111") from actual conversion characteristics

includes zero transition error, full-scale transition error, and non linearity error.

Differential linearity error: Deviation from the ideal value of the input voltage required for changing the output code by 1 LSB

Total error: Difference between the actual value and the theoretical value. The total error

Total error



$$\text{Total error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N-1) + 0.5\text{LSB}\}}{1\text{LSB}}\ [\text{LSB}]$$

$$1\text{LSB (Ideal value)} = \frac{\text{AVRH} - \text{AVRL}}{4096}\ [\text{V}]$$

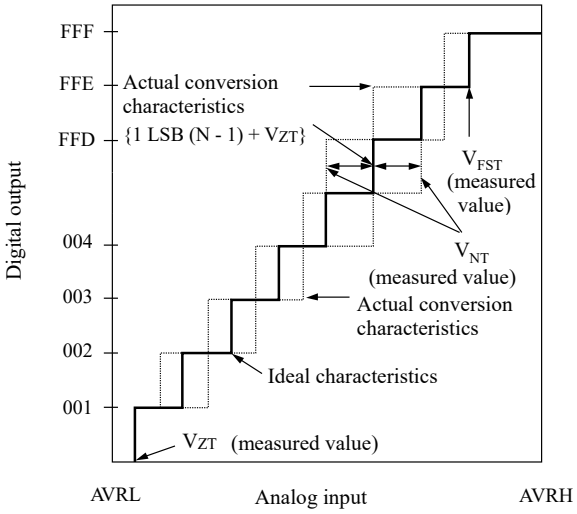
N: A/D converter digital output value.

V_{ZT} (Ideal value) = AVRL + 0.5LSB[V]

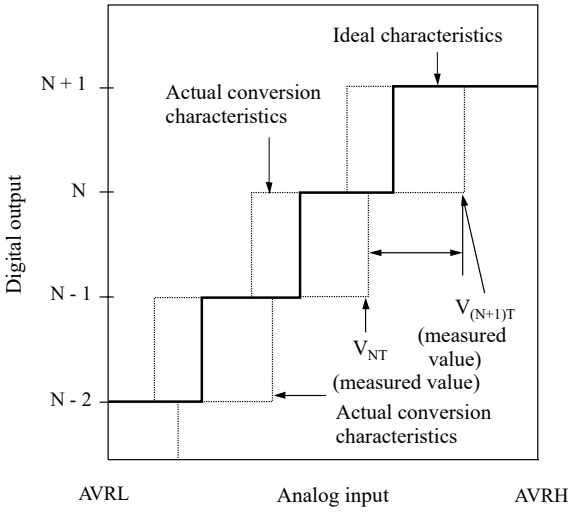
V_{FST} (Ideal value) = AVRH - 1.5LSB[V]

V_{NT}: Voltage at which the digital output changes from "(N – 1)" to "N".

Integral linearity error



Differential linearity error



$$\text{Integral linearity error of digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (N-1) + V_{ZT}\}}{1\text{LSB}}\ [\text{LSB}]$$

$$\text{Differential linearity error of digital output N} = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1\ \text{LSB}\ [\text{LSB}]$$

$$1\text{LSB} = \frac{V_{FST} - V_{ZT}}{4094}\ [\text{V}]$$

V_{ZT}: Voltage for which digital output changes from "0x000" to "0x001"

V_{FST}: Voltage for which digital output changes from "0xFFE" to "0xFFF".

*3: These values do not include the noise caused by the analog power supply. (Refer to *7. Use examples)

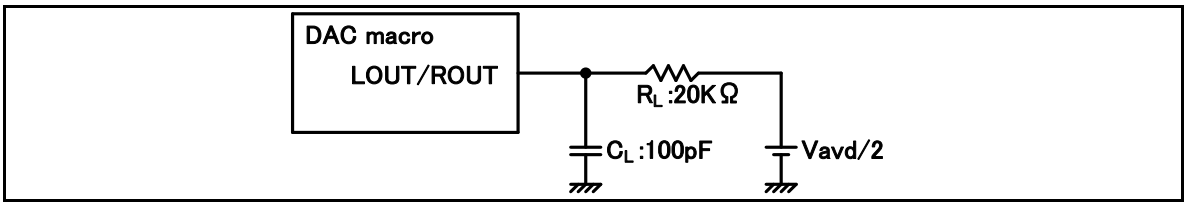
*4: 2.2 µF is connected to C_L, C_R.

*5: Load connection

R_L is connected to AVCC3_DAC /2 (Figure 9.1).

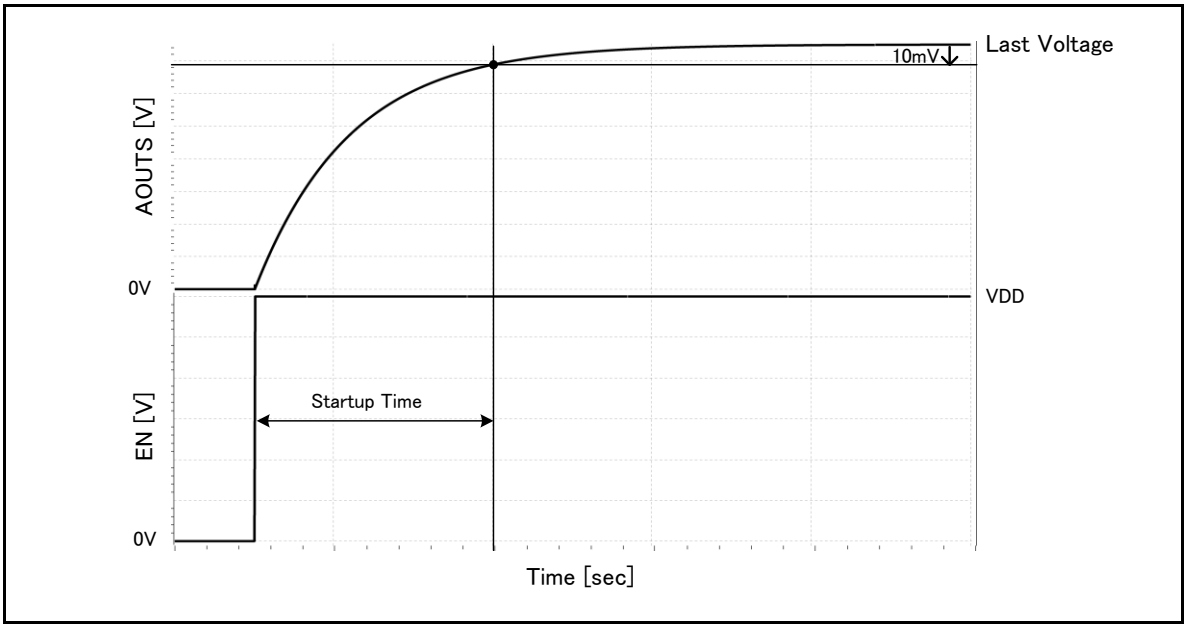
If R_L is connected to ground, the coupling capacitance must be inserted as shown in (Figure 9.3)

Figure 9-1: Connection between R_L and AVCC_DAC/2 (Example)



*6: Start up time

Figure 9-2: Startup Time



*Start up time can be calculated as follows.

1.Start up time (TYP) = 650[ms] (*4)

2.CCOM = 10 µF × (1 ± α/100)

CCOM is a capacitor connected to Terminal C_L/C_R including capacitance variance.

α = Capacitance variance[%]

3.Start up time = Start up time (TYP) × (1±α) [ms]

For example, CCOM = 2.42 µF then α = (2.42 µF - 2.2 µF)/2.2 µF = 10[%]

So, Start up time = 650 ms × (1+10/100) = 715[ms]

9.1.7.2 Notes

While the Flash memory is written or erased, shutdown of the external power (Vcc5) is prohibited.

In the application system where Vcc5 might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function.

To put it concretely, after the external power supply voltage falls below the detection voltage (V_{DL}), hold Vcc5 at 2.7 V or more within the duration calculated by the following expression:

Td^{*1} [µs] + (1 / F_{CRF}^{*2}[MHz]) x 1029 + 25 [µs]

The following table defines the errata applicability to available S6J3310/3320/3330/3340 Series devices.

Items	Part Number	Fix Status
MCAN wrong message transmission	S6J331xxxx S6J332xxxx S6J333xxxx S6J334xxxx	Not be planned.

1. MCAN wrong message transmission

■ Problem Definition

There is a possibility a message with an ID (arbitration field) and a format and DLC (control field) is transmitted which was not configured by the application. The message itself is syntactically correct and can be received by other nodes.

The occurrence of the limitation requires a certain relationship in time between a transmission request for sending a message and the coincidence of noise in the 3rd bit of intermission field which is treated as the start of new message transmission (SoF).

■ Trigger Condition

Under the following conditions a message with wrong ID, format and DLC is transmitted:

- M_CAN is in state "Receiver" (PSR.ACT = "10"), no pending transmission.
- A new transmission is requested after sample point of 2nd bit of intermission but before the 3rd bit of Intermission is reached.
- The CAN bus is sampled dominant at the third bit of Intermission which is treated as SoF (see ISO11898-1:2015 Section 10.4.2.2).

■ Scope of Impact

Under the conditions listed above it may happen, that:

- The shift register is not loaded with ID, format, and DLC of the requested message.
- The M_CAN will start arbitration with wrong ID, format, and DLC.

- In case the ID won arbitration, a CAN message with valid CRC is transmitted.
- In case this message is acknowledged, the ID stored in the Tx Event FIFO is the ID of the requested Tx message and not the ID of the message transmitted on the CAN bus
- Neither an error is detected by the transmitting node nor at the receiving node.

■ Workaround

Workaround 1:

This workaround avoids submitting a transmission request in the critical time window of about one bit time before the sample point of the 3rd bit of intermission field when on other pending transmission request exists:

- Request a new transmission if another transmission is already pending or when the M_CAN / M_TTCAN is not in state "Receiver" (when PSR.ACT ≠ "10").
- If no pending transmission request exists, the application software needs to evaluate the Rx Interrupt flags IR.DRX, IR.RF0N, IR.RF1N which are set at the last bit of EoF when a received and accepted message gets valid.
- A new transmission may be requested by writing to TXBAR once the Rx interrupt occurred and the application waited another 3 bit times before submitting its Tx request. Note the Rx interrupt is generated at the last bit of EoF which is followed by three bits of Intermission.
- The application has to take care that the transmission request for the CAN Protocol Controller is activated before the critical window of the following reception is reached.

A supplemental action can be applied in order to detect messages which contain wrong ID and control filed information:

- A checksum covering arbitration and control fields can be added to the data field of the message to be transmitted, to detect frames transmitted with wrong arbitration and control fields.

Workaround 2:

This workaround ensures that always at least one pending Tx request exists. If that is the case, the application may launch its Tx requests at any time without suffering from the limitation.

- Define a low priority message with DLC = 0 that can be sent without harm. E.g. loses arbitration against all other application messages, does not pass any acceptance filter of nodes in the same network. DLC = 0 shall reduce latency for other application messages.
- Configure sufficient Tx buffers – at least two - for this message type thus that there is always another one waiting to be sent. E.g. an application that cannot react quickly enough with the time a single message of this type is sent, more than 2 Tx buffer may become necessary.
- The application uses the standard interfaces of the CAN / CAN FD stack to feed these messages.
- Whenever Tx confirmation is indicated for the second but last message of this type with pending Tx request, the application needs to submit at least one new Tx request. Note Tx confirmation is a standard feature in the AUTOSAR SW architecture.
- Before initially leaving INIT state of the M_CAN IP by clearing CCCR.INIT bit, make sure to activate a Tx request after having cleared CCCR.CCE. This will ensure that the conditions for the occurrence of the limitation when synchronizing to the CAN bus the first time after RESET are prevented.

■ Fix Status

Not be planned.

159	8.2Handling Devices	Added Note of a function as below: Method to Switch off VCC12 during Power-off Sequence During power-off sequence, it is necessary to switch off VCC12 by driving PSC1 pin low by entering PSS mode (power domain 2 off). If VCC12 needs to be switched off by other means, RSTX needs to be asserted before switching off VCC12 to inactivate the operation of VCC12 supplied domain below the operation assurance range.

159 160	9.Electric Characteristics 9.1.1 Absolute Maximum Rating	Added Note of a comment as below: Maximum clamp current, Total maximum clamp current Correct) *13 VI or VO should never exceed the specified ratings. However, if the maximum current to/from an input is limited by a suitable external resistor, the ICLAMP rating supersedes the VI rating.
161	9.Electric Characteristics 9.1.1 Absolute Maximum Rating	Revised Warning of a comment as below: Error) Note: − Application of stress (e.g., voltage, current, temperature) exceeding the absolute maximum rating may cause damage to the semiconductor device. Therefore, make sure that nothing exceeds the rating. Correct) WARNING: − Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

Try to prevent such overvoltage or over-current conditions at the design stage.
159	8.Precautions and Handling Devices 8.2.Handling Devices	Revised as below: Correct) **Method to Switch Off VCC12 during Power-Off Sequence** During power-off sequence, it is necessary to switch off VCC12 by driving PSC1 pin low by entering PSS mode (power domain 2 off). This detection voltage level setting is below the minimum operation assurance voltage (2.7V*2 *3 or 4.0V*1) . Between this detection voltage and the minimum operation assurance voltage, MCU functions are not guaranteed except for the low voltage detector. Note that although the detection level is below the minimum operation guarantee voltage, the LVD reset factor flag is set as the voltage drops below the detection level. Correct) LVDL0 LVDL1 LVDL2 LVDH0 LVDH1 LVDH2 When it is used outside recommended range (this is the range of guaranteed operation), contact your sales representative.The initial detection voltage of the external low voltage detection is 2.6V±3.5%*2 *3(LVDH1/LVDH2) or 0.8V±3.5%(LVDL2). This LVD setting and internal LVD (LVDL0/LVDL1) cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage.

177	9. Electric Characteristics 9.1.2 Recommended operating condition	Error) - Correct) Note: −TA: Ambient temperature (JEDEC) −TC: Case temperature (JEDEC), the maximum measured temperature of package case top. −Both rating of TA and TC should simultaneously be satisfied as maximum operation temperature. −The following condition should be satisfied in order to facilitate heat dissipation. 1. Four or more layers PCB should be used. 2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard) 3. One layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90% or more. The layer can be used for system ground. 4. 35% or more of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer. 5. The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes. Example thermal via holes on PCB <Figure> − The above figure is a schematic diagram showing PCB in section. − Thermal via holes should closely be placed and aligned with lands. − It is recommended to connect the land pattern to the VSS-ground level (GND plan of inner layer bellow the MCU) as thermal heat sink.

11	3: Product Description 3.2. Product Description	Feature: PLL / SSCG PLL Error) Down spread mode is only supported and available. Correct) Product supports down spread and center spread modes with the conditions defined in 9.1.4.3 "Internal Clock Timing".
12	3: Product Description 3.2. Product Description	Feature: Embedded Program/Work Flash Memory Error) Work Flash can be accessed with 0-wait-cycle if CPU frequency is 12.5MHz or less. 7-wait-cycle: 80MHz or less. 13-wait-cycle: 160MHz or less. Correct) Work Flash can be accessed with 0-wait-cycle if CPU frequency is 12.5MHz or less. 6-wait-cycle: 80MHz or less. 12-wait-cycle: 160MHz or less.

13	3: Product Description 3.2. Product Description	Feature: I2S Error) − I2S has its own PPU, but the function is fixed to disable. Correct) -
14	3: Product Description 3.2. Product Description	Feature: Multi-Functional Serial (MFS) Error) Some ports of MFS have the dedicated I/O for I^2C. See Port description list in detail. When the voltage supply of I^2C interface is 5.0 V, it cannot use the I/O cells of 3.3 V voltage supply for the I^2C terminal. CTS/RTS is not mounted (hardware flow control is not supported for this series.) Correct) Only 2 ports of MFS have the dedicated I/O for I^2C. See I^2C timing in 9.1.4.6 Multi-Function Serial in detail. The I^2C is not designed to be hot swappable. CTS/RTS is not mounted (hardware flow control is not supported for this series.)

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
