

# Small Footprint MII/RMII 10/100 Energy Efficient Ethernet Transceiver with HP Auto-MDIX and flexPWR® Technology

## **Highlights**

- Single-Chip Ethernet Physical Layer Transceiver (PHY)
- Compliant with Energy Efficient Ethernet 802.3az
- Comprehensive flexPWR technology
  - Flexible power management architecture
  - LVCMOS Variable I/O voltage range: +1.8 V to +3.3 V
  - Integrated 1.2 V regulator with disable feature
- HP Auto-MDIX support
- Small footprint 32-pin VQFN, RoHS-compliant package (5 x 5 x 0.9 mm height)
- Deterministic 100 Mb internal loopback latency (MII Mode)

## **Target Applications**

- · Set-Top Boxes
- · Networked Printers and Servers
- · Test Instrumentation
- · LAN on Motherboard
- · Embedded Telecom Applications
- · Video Record/Playback Systems
- · Cable Modems/Routers
- · DSL Modems/Routers
- · Digital Video Recorders
- · IP and Video Phones
- · Wireless Access Points
- Digital Televisions
- Digital Media Adapters/Servers
- Gaming Consoles
- POE Applications
   (Refer to Microchip Application Note 17.18)

## **Key Benefits**

- High-performance 10/100 Ethernet transceiver
  - Compliant with IEEE802.3/802.3u (Fast Ethernet)
  - Compliant with ISO 802-3/IEEE 802.3 (10BASE-T)
  - Compliant with Energy Efficient Ethernet IEEE 802.3az
  - Loop-back modes
  - Auto-negotiation
  - Automatic polarity detection and correction
  - Link status change wake-up detection
  - Vendor specific register functions
  - Supports both MII and the reduced pin count RMII interface
- · Power and I/Os
  - Various low power modes
  - Integrated power-on reset circuit
  - Two status LED outputs
  - May be used with a single 3.3 V supply
- · Additional Features
  - Ability to use a low cost 25 MHz crystal for reduced BOM
- · Packaging
  - 32-pin VQFN (5 x 5 mm), RoHS-compliant package with MII and RMII
- Environmental
  - Commercial temperature range (0°C to +70°C)
  - Industrial temperature range (-40°C to +85°C)

### TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

#### **Most Current Data Sheet**

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

#### http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

#### **Errata**

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- · Microchip's Worldwide Web site: http://www.microchip.com
- · Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

## **Customer Notification System**

## 1.0 INTRODUCTION

### 1.1 General Terms and Conventions

The following is a list of the general terms used throughout this document:

BYTE 8 bits

FIFO First In First Out buffer; often used for elasticity buffer

MAC Media Access Controller

MII Media Independent Interface

RMII™ Reduced Media Independent Interface

N/A Not Applicable

X Indicates that a logic state is "don't care" or undefined.

**RESERVED** Refers to a reserved bit field or address. Unless otherwise noted, reserved bits must always be zero

for write operations. Unless otherwise noted, values are not guaranteed when reading reserved bits.

Unless otherwise noted, do not read or write to reserved addresses.

SMI Serial Management Interface

## 1.2 General Description

The LAN8741Ai is a low-power 10BASE-T/100BASE-TX physical layer (PHY) transceiver with variable I/O voltage that is compliant with the IEEE 802.3, 802.3u, and 802.3az (Energy Efficient Ethernet) standards. Energy Efficient Ethernet (EEE) support results in significant power savings during low link utilizations.

The LAN8741Ai supports communication with an Ethernet MAC via a standard MII (IEEE 802.3u)/RMII interface. It contains a full-duplex 10-BASE-T/100BASE-TX transceiver and supports 10 Mbps (10BASE-T) and 100 Mbps (100BASE-TX) operation. The LAN8741A/LAN8741Ai implements auto-negotiation to automatically determine the best possible speed and duplex mode of operation. HP Auto-MDIX support allows the use of direct connect or cross-over LAN cables.

The LAN8741Ai supports both IEEE 802.3-2005 compliant and vendor-specific register functions. However, no register access is required for operation. The initial configuration may be selected via the configuration pins as described in Section 3.7, "Configuration Straps". Register-selectable configuration options may be used to further define the functionality of the transceiver.

Per IEEE 802.3-2005 standards, all digital interface pins are tolerant to 3.6 V. The device can be configured to operate on a single 3.3 V supply utilizing an integrated 3.3 V to 1.2 V linear regulator. The linear regulator may be optionally disabled, allowing usage of a high efficiency external regulator for lower system power dissipation.

The LAN8741A/LAN8741Ai is available in commercial (0°C to +70°C) and industrial (-40°C to +85°C) temperature range versions. A typical system application is shown in Figure 1-1. Figure 1-2 provides an internal block diagram of the device.

## 2.0 PIN DESCRIPTION AND CONFIGURATION

FIGURE 2-1: 32-VQFN PIN ASSIGNMENTS (TOP VIEW)

**Note:** When a lower case "n" is used at the beginning of the signal name, it indicates that the signal is active low. For example, nRST indicates that the reset signal is active low.

**Note:** The buffer type for each signal is indicated in the BUFFER TYPE column. A description of the buffer types is provided in Section 2.2.

TABLE 2-1: MII/RMII SIGNALS

Num Pins	Name	Symbol	Buffer Type	Description
1	Transmit Data 0	TXD0	VIS	The MAC transmits data to the transceiver using this signal in all modes.
1	Transmit Data 1	TXD1	VIS	The MAC transmits data to the transceiver using this signal in all modes.
1	Transmit Data 2	TXD2	VIS	The MAC transmits data to the transceiver using this signal in MII mode.
	(MII Mode)			<b>Note:</b> This signal must be grounded in RMII mode.
1	Transmit Data 3	TXD3	VIS	The MAC transmits data to the transceiver using this signal in MII mode.
	(MII Mode)			Note: This signal must be grounded in RMII mode.
1	Interrupt Out- put	nINT	VOD8 (PU)	Active low interrupt output. Place an external resistor pull-up to VDDIO.
				Note: Refer to Section 3.6, "Interrupt Management" for additional details on device interrupts.
				Note: Refer to Section 3.8.1.2, "nINTSEL and LED2 Polarity Selection" for details on how the <u>nINTSEL</u> configuration strap is used to determine the function of this pin.
	Transmit Error (MII Mode)	TXER	VIS	When driven high, the 4B/5B encode process substitutes the Transmit Error code-group (/H/) for the encoded data word. This input is ignored in the 10BASE-T mode of operation. This signal is also used in EEE mode as TXER when TXEN = 1, and as LPI when TXEN = 0.
				Note: This signal is not used in RMII mode.
	Transmit Data 4 (MII Mode)	TXD4	VIS (PU)	In Symbol Interface (5B decoding) mode, this signal becomes the MII Transmit Data 4 line (the MSB of the 5-bit symbol code-group).
				Note: This signal is not used in RMII mode.
1	Transmit Enable	TXEN	VIS (PD)	Indicates that valid transmission data is present on TXD[3:0]. In RMII mode, only TXD[1:0] provide valid data.
1	Transmit Clock (MII Mode)	TXCLK	VO8	Used to latch data from the MAC into the transceiver.  • MII (100BASE-TX): 25 MHz  • MII (10BASE-T): 2.5 MHz  Note: This signal is not used in RMII mode.
·	Enable Transmit Clock		(PD)	TXD[3:0]. In RMII mode, only TXE valid data.  Used to latch data from the MAC i ceiver.  • MII (100BASE-TX): 25 MHz  • MII (10BASE-T): 2.5 MHz

TABLE 2-1: MII/RMII SIGNALS (CONTINUED)

Num Pins	Name	Symbol	Buffer Type	Description
1	Receive Data 0	RXD0	VO8	Bit 0 of the 4 (2 in RMII mode) data bits that are sent by the transceiver on the receive path.
	PHY Operat- ing Mode 0 Configuration	MODE0	VIS (PU)	Combined with MODE1 and MODE2, this configuration strap sets the default PHY mode.
	Strap			See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.2, "MODE[2:0]:  Mode Configuration" for additional details.
1	Receive Data 1	RXD1	VO8	Bit 1 of the 4 (2 in RMII mode) data bits that are sent by the transceiver on the receive path.
	PHY Operat- ing Mode 1 Configuration	MODE1	VIS (PU)	Combined with <u>MODE0</u> and <u>MODE2</u> , this configuration strap sets the default PHY mode.
	Strap			See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.2, "MODE[2:0]:  Mode Configuration" for additional details.
1	Receive Data 2	RXD2	VO8	Bit 2 of the 4 (in MII mode) data bits that are sent by the transceiver on the receive path.
	(MII Mode)			Note: This signal is not used in RMII mode.
	MII/RMII Mode Select Configu- ration Strap	<u>RMIISEL</u>	VIS (PD)	This configuration strap selects the MII or RMII mode of operation. When strapped low to VSS, MII mode is selected. When strapped high to VDDIO RMII mode is selected.
				See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.3, "RMIISEL: MII/RMII Mode Configuration" for additional details.
1	Receive Data 3	RXD3	VO8	Bit 3 of the 4 (in MII mode) data bits that are sent by the transceiver on the receive path.
	(MII Mode)			Note: This signal is not used in RMII mode.
	PHY Address 2 Configuration Strap	PHYAD2	VIS (PD)	Combined with <u>PHYAD0</u> and <u>PHYAD1</u> , this configuration strap sets the transceiver's SMI address.
				See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.1, "PHYAD[2:0]: PHY Address Configuration" for additional information.

TABLE 2-1: MII/RMII SIGNALS (CONTINUED)

Num Pins	Name	Symbol	Buffer Type	Description
1	Receive Error	RXER	VO8	This signal is asserted to indicate that an error was detected somewhere in the frame presently being transferred from the transceiver. This signal is also used in EEE mode as RXER when RXDV = 1, and as LPI when RXDV = 0.
				Note: This signal is optional in RMII mode.
	Receive Data 4 (MII Mode)	RXD4	VO8	In Symbol Interface (5B decoding) mode, this signal is the MII Receive Data 4 signal, the MSB of the received 5-bit symbol code-group.
				<b>Note:</b> Unless configured to the Symbol Interface mode, this pin functions as RXER.
	PHY Address 0 Configuration Strap	PHYAD0	VIS (PD)	Combined with <u>PHYAD1</u> and <u>PHYAD2</u> , this configuration strap sets the transceiver's SMI address.
	·			See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.1, "PHYAD[2:0]: PHY Address Configuration" for additional information.
1	Receive Clock (MII Mode)	RXCLK	VO8	In MII mode, this pin is the receive clock output.  • MII (100BASE-TX): 25 MHz  • MII (10BASE-T): 2.5 MHz
	PHY Address 1 Configuration Strap	PHYAD1	VIS (PD)	Combined with <u>PHYAD0</u> and <u>PHYAD2</u> , this configuration strap sets the transceiver's SMI address.
				See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.1, "PHYAD[2:0]: PHY Address Configuration" for additional information.
1	Receive Data Valid	RXDV	VO8	Indicates that recovered and decoded data is available on the RXD pins.
1	Collision Detect (MII Mode)	COL	VO8	This signal is asserted to indicate detection of a collision condition in MII mode.
	Carrier Sense / Receive Data Valid (RMII Mode)	CRS_DV	VO8	This signal is asserted to indicate the receive medium is non-idle in RMII mode. When a 10BASE-T packet is received, CRS_DV is asserted, but RXD[1:0] is held low until the SFD byte (10101011) is received.
				Note: Per the RMII standard, transmitted data is not looped back onto the receive data pins in 10BASE-T half-duplex mode.
	PHY Operat- ing Mode 2 Configuration	MODE2	VIS (PU)	Combined with MODE0 and MODE1, this configuration strap sets the default PHY mode.
	Strap			See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.2, "MODE[2:0]:  Mode Configuration" for additional details.

TABLE 2-1: MII/RMII SIGNALS (CONTINUED)

Num Pins	Name	Symbol	Buffer Type	Description
1	Carrier Sense	CRS	VO8	This signal indicates detection of a carrier in MII
	(MII Mode)		(PD)	mode.

**Note 1:** Configuration strap values are latched on power-on reset and system reset. Configuration straps are identified by an underlined symbol name. Signals that function as configuration straps must be augmented with an external resistor when connected to a load. Refer to Section 3.7, "Configuration Straps" for additional information.

**TABLE 2-2: LED PINS** 

Num Pins	Name	Symbol	Buffer Type	Description
1	LED 1	LED1	O12	Link activity LED indication. This pin is driven active when a valid link is detected and blinks when activity is detected.
				<b>Note:</b> Refer to Section 3.8.1, "LEDs" for additional LED information.
	Regulator Off Configuration Strap	REGOFF	IS (PD)	This configuration strap is used to disable the internal 1.2 V regulator. When the regulator is disabled, external 1.2 V must be supplied to VDDCR.
				When <u>REGOFF</u> is pulled high to VDD2A with an external resistor, the internal regulator is disabled.
				When <u>REGOFF</u> is floating or pulled low, the internal regulator is enabled (default).
				See Note 1 for more information on configuration straps.
				Note: Refer to Section 3.7.4, "REGOFF: Internal +1.2 V Regulator Configuration" for additional details.
1	LED 2	LED2	O12	Link speed LED indication. This pin is driven active when the operating speed is 100 Mbps. It is inactive when the operating speed is 10 Mbps or during line isolation.
				<b>Note:</b> Refer to Section 3.8.1, "LEDs" for additional LED information.
	nINT/TXER/ TXD4 Function Select Configu-	<u>nINTSEL</u>	IS (PU)	This configuration strap selects the mode of the nINT/TXER/TXD4 pin.
	ration Strap			When <u>nINTSEL</u> is floated or pulled to VDD2A, nINT is selected for operation on the nINT/TXER/TXD4 pin (default).
				When <u>nINTSEL</u> is pulled low to VSS, TXER/TXD4 is selected for operation on the nINT/TXER/TXD4 pin.
				See Note 1 for more information on configuration straps.
				Note: Refer to See Section 3.8.1.2, "nINTSEL and LED2 Polarity Selection" for additional information.

**Note 1:** Configuration strap values are latched on power-on reset and system reset. Configuration straps are identified by an underlined symbol name. Signals that function as configuration straps must be augmented with an external resistor when connected to a load. Refer to Section 3.7, "Configuration Straps" for additional information.

TABLE 2-3: SERIAL MANAGEMENT INTERFACE (SMI) PINS

Num Pins	Name	Symbol	Buffer Type	Description
1	SMI Data Input/Output	MDIO	VIS/ VO8 (PU)	Serial Management Interface data input/output
1	SMI Clock	MDC	VIS	Serial Management Interface clock

### **TABLE 2-4: ETHERNET PINS**

Num Pins	Name	Symbol	Buffer Type	Description
1	Ethernet TX/RX Posi- tive Channel 1	TXP	AIO	Transmit/Receive Positive Channel 1
1	Ethernet TX/RX Nega- tive Channel 1	TXN	AIO	Transmit/Receive Negative Channel 1
1	Ethernet TX/RX Posi- tive Channel 2	RXP	AIO	Transmit/Receive Positive Channel 2
1	Ethernet TX/RX Nega- tive Channel 2	RXN	AIO	Transmit/Receive Negative Channel 2

## TABLE 2-5: MISCELLANEOUS PINS

Num Pins	Name	Symbol	Buffer Type	Description
1	External Crystal Input	XTAL1	ICLK	External crystal input
	External Clock Input	CLKIN	ICLK	Single-ended clock oscillator input.  Note: When using a single ended clock oscillator, XTAL2 should be left unconnected.
1	External Crystal Out- put	XTAL2	OCLK	External crystal output
1	External Reset	nRST	VIS (PU)	System reset. This signal is active low.

TABLE 2-6: ANALOG REFERENCE PINS

Num Pins	Name	Symbol	Buffer Type	Description
1	External 1% Bias Resistor Input	RBIAS	Al	This pin requires connection of a 12.1 k $\Omega$ (1%) resistor to ground. Refer to the LAN8741A/LAN8741Ai reference schematic for connection information.
				Note: The nominal voltage is 1.2 V and the resistor will dissipate approximately 1 mW of power.

## **TABLE 2-7: POWER PINS**

Num Pins	Name	Symbol	Buffer Type	Description
1	+1.8 V to +3.3 V Variable I/O Power	VDDIO	Р	+1.8 V to +3.3 V variable I/O power.  Refer to the LAN8741A/LAN8741Ai reference schematic for connection information.
1	+1.2 V Digital Core Power Supply	VDDCR	Р	Supplied by the on-chip regulator unless configured for regulator off mode via the REGOFF configuration strap.  Refer to the LAN8741A/LAN8741Ai reference schematic for connection information.  Note: 1 µF and 470 pF decoupling capacitors in parallel to ground should be used on this pin.
1	+3.3 V Channel 1 Analog Port Power	VDD1A	Р	+3.3 V Analog Port Power to Channel 1.  Refer to the LAN8741A/LAN8741Ai reference schematic for connection information.
1	+3.3 V Channel 2 Analog Port Power	VDD2A	Р	+3.3 V Analog Port Power to Channel 2 and the internal regulator.  Refer to the LAN8741A/LAN8741Ai reference schematic for connection information.
1	Ground	VSS	Р	Common ground. This exposed pad must be connected to the ground plane with a via array.

## 2.1 Pin Assignments

TABLE 2-8: 32-VQFN PACKAGE PIN ASSIGNMENTS

Pin Num	Pin Name	Pin Num	Pin Name
1	VDD2A	17	MDC
2	LED2/ <u>nINTSEL</u>	18	nINT/TXER/TXD4
3	LED1/REGOFF	19	nRST
4	XTAL2	20	TXCLK
5	XTAL1/CLKIN	21	TXEN
6	VDDCR	22	TXD0
7	RXCLK/ <u>PHYAD1</u>	23	TXD1
8	RXD3/ <u>PHYAD2</u>	24	TXD2
9	RXD2/ <u>RMIISEL</u>	25	TXD3
10	RXD1/MODE1	26	RXDV
11	RXD0/MODE0	27	VDD1A
12	VDDIO	28	TXN
13	RXER/RXD4/ <u>PHYAD0</u>	29	TXP
14	CRS	30	RXN
15	COL/CRS_DV/MODE2	31	RXP
16	MDIO	32	RBIAS

## 2.2 Buffer Types

## **TABLE 2-9: BUFFER TYPES**

Buffer Type	Description			
IS	Schmitt-triggered input			
O12	Output with 12 mA sink and 12 mA source			
VIS	Variable voltage Schmitt-triggered input			
VO8	Variable voltage output with 8 mA sink and 8 mA source			
VOD8	Variable voltage open-drain output with 8 mA sink			
PU	$50~\mu\text{A}$ (typical) internal pull-up. Unless otherwise noted in the pin description, internal pull-ups are always enabled.			
	<b>Note:</b> Internal pull-up resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled high, an external resistor must be added.			
PD	50 μA (typical) internal pull-down. Unless otherwise noted in the pin description, internal pull-downs are always enabled.			
	Note: Internal pull-down resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled low, an external resistor must be added.			
Al	Analog input			
AIO	Analog bi-directional			
ICLK	Crystal oscillator input pin			
OCLK	Crystal oscillator output pin			
Р	Power pin			

Note:	The digital signals are not 5 V tolerant. Refer to Section 5.1, "Absolute Maximum Ratings*" for additional
	buffer information.

**Note:** Sink and source capabilities are dependent on the VDDIO voltage. Refer to Section 5.1, "Absolute Maximum Ratings\*" for additional information.

## 3.0 FUNCTIONAL DESCRIPTION

This chapter provides functional descriptions of the various device features. These features have been categorized into the following sections:

- Transceiver
- · Auto-Negotiation
- HP Auto-MDIX Support
- · MAC Interface
- Serial Management Interface (SMI)
- Interrupt Management
- · Configuration Straps
- · Miscellaneous Functions
- · Application Diagrams

### 3.1 Transceiver

#### 3.1.1 100BASE-TX TRANSMIT

The 100BASE-TX transmit data path is shown in Figure 3-1. Each major block is explained in the following subsections.

#### FIGURE 3-1: 100BASE-TX TRANSMIT DATA PATH

### 3.1.1.1 100BASE-TX Transmit Data Across the MII/RMII Interface

For MII, the MAC controller drives the transmit data onto the TXD bus and asserts TXEN to indicate valid data. The data is latched by the transceiver's MII block on the rising edge of TXCLK. The data is in the form of 4-bit wide 25 MHz data.

For RMII, the MAC controller drives the transmit data onto the TXD bus and asserts TXEN to indicate valid data. The data is latched by the transceiver's RMII block on the rising edge of REF\_CLK. The data is in the form of 2-bit wide 50 MHz data.

### 3.1.1.2 4B/5B Encoding

The transmit data passes from the MII/RMII block to the 4B/5B encoder. This block encodes the data from 4-bit nibbles to 5-bit symbols (known as "code-groups") according to Table 3-1. Each 4-bit data-nibble is mapped to 16 of the 32 possible code-groups. The remaining 16 code-groups are either used for control information or are not valid.

The first 16 code-groups are referred to by the hexadecimal values of their corresponding data nibbles, 0 through F. The remaining code-groups are given letter designations with slashes on either side. For example, an IDLE code-group is /I/, a transmit error code-group is /H/, etc.

TABLE 3-1: 4B/5B CODE TABLE

Code Group	Sym	Receiver Interpretation		Transmitter Interpretation				
11110	0	0	0000	DATA	0	0000	DATA	
01001	1	1	0001		1	0001		
10100	2	2	0010		2	0010		
10101	3	3	0011		3	0011		
01010	4	4	0100		4	0100		
01011	5	5	0101		5	0101		
01110	6	6	0110		6	0110		
01111	7	7	0111		7	0111		
10010	8	8	1000		8	1000		
10011	9	9	1001		9	1001		
10110	Α	Α	1010		Α	1010		
10111	В	В	1011		В	1011		
11010	С	С	1100		С	1100		
11011	D	D	1101		D	1101		
11100	Е	E	1110		Е	1110		
11101	F	F	1111		F	1111		
11111	I	IDLE			Sent after /T/R until TXEN			
11000	J		First nibble of SSD, translated to "0101" following IDLE, else RXER			g TXEN		
10001	K	Second nibble of SSD, translated to "0101" following J, else RXER			Sent for rising	g TXEN		
01101	T	First nibble of ESD, causes de-assertion of CRS if followed by /R/, else assertion of RXER			Sent for falling	ng TXEN		
00111	R	Second nibble of ESD, causes deassertion of CRS if following /T/, else assertion of RXER			Sent for falling	ng TXEN		
00100	Н	Transmit Erro	Transmit Error Symbol			g TXER		
00110	V	INVALID, RX	ER if during RX	DV	INVALID			
11001	V	INVALID, RX	INVALID, RXER if during RXDV					
00000	V		Indicates to receiver that the transmitter will be going to LPI			PI. Used to tell nitter goes to LF	PI. Also use	
00001	V	INVALID, RX	INVALID, RXER if during RXDV					
00010	V	INVALID, RX	INVALID, RXER if during RXDV			INVALID		
00011	V	INVALID, RX	INVALID, RXER if during RXDV			INVALID		
00101	V	INVALID, RX	INVALID, RXER if during RXDV			INVALID		
01000	V	INVALID, RX	INVALID, RXER if during RXDV			INVALID		
01100	V	INVALID, RX	INVALID, RXER if during RXDV					
10000	V	INVALID, RX	INVALID, RXER if during RXDV				_	

### 3.1.1.3 Scrambling

Repeated data patterns (especially the IDLE code-group) can have power spectral densities with large narrow-band peaks. Scrambling the data helps eliminate these peaks and spread the signal power more uniformly over the entire channel bandwidth. This uniform spectral density is required by FCC regulations to prevent excessive EMI from being radiated by the physical wiring.

The seed for the scrambler is generated from the transceiver address, PHYAD, ensuring that in multiple-transceiver applications, such as repeaters or switches, each transceiver will have its own scrambler sequence.

The scrambler also performs the Parallel In Serial Out conversion (PISO) of the data.

#### 3.1.1.4 NRZI and MLT-3 Encoding

The scrambler block passes the 5-bit wide parallel data to the NRZI converter where it becomes a serial 125 MHz NRZI data stream. The NRZI is encoded to MLT-3. MLT-3 is a tri-level code where a change in the logic level represents a code bit "1" and the logic output remaining at the same level represents a code bit "0".

#### 3.1.1.5 100M Transmit Driver

The MLT3 data is then passed to the analog transmitter, which drives the differential MLT-3 signal, on outputs TXP and TXN, to the twisted pair media across a 1:1 ratio isolation transformer. The 10BASE-T and 100BASE-TX signals pass through the same transformer so that common "magnetics" can be used for both. The transmitter drives into the 100  $\Omega$  impedance of the CAT-5 cable. Cable termination and impedance matching require external components.

## 3.1.1.6 100M Phase Lock Loop (PLL)

The 100M PLL locks onto reference clock and generates the 125 MHz clock used to drive the 125 MHz logic and the 100BASE-TX transmitter.

### 3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receive data path is shown in Figure 3-2. Each major block is explained in the following subsections.

## FIGURE 3-2: 100BASE-TX RECEIVE DATA PATH

## 3.1.2.1 100M Receive Input

The MLT-3 from the cable is fed into the transceiver (on inputs RXP and RXN) via a 1:1 ratio transformer. The ADC samples the incoming differential signal at a rate of 125M samples per second. Using a 64-level quanitizer, it generates 6 digital bits to represent each sample. The DSP adjusts the gain of the ADC according to the observed signal levels such that the full dynamic range of the ADC can be used.

## 3.1.2.2 Equalizer, Baseline Wander Correction and Clock and Data Recovery

The 6 bits from the ADC are fed into the DSP block. The equalizer in the DSP section compensates for phase and amplitude distortion caused by the physical channel consisting of magnetics, connectors, and CAT- 5 cable. The equalizer can restore the signal for any good-quality CAT-5 cable between 1 m and 100 m.

If the DC content of the signal is such that the low-frequency components fall below the low frequency pole of the isolation transformer, then the droop characteristics of the transformer will become significant and Baseline Wander (BLW) on the received signal will result. To prevent corruption of the received data, the transceiver corrects for BLW and can receive the ANSI X3.263-1995 FDDI TP-PMD defined "killer packet" with no bit errors.

The 100M PLL generates multiple phases of the 125 MHz clock. A multiplexer, controlled by the timing unit of the DSP, selects the optimum phase for sampling the data. This is used as the received recovered clock. This clock is used to extract the serial data from the received signal.

#### 3.1.2.3 NRZI and MLT-3 Decoding

The DSP generates the MLT-3 recovered levels that are fed to the MLT-3 converter. The MLT-3 is then converted to an NRZI data stream.

## 3.1.2.4 Descrambling

The descrambler performs an inverse function to the scrambler in the transmitter and also performs the Serial In Parallel Out (SIPO) conversion of the data.

During reception of IDLE (/l/) symbols. the descrambler synchronizes its descrambler key to the incoming stream. Once synchronization is achieved, the descrambler locks on this key and is able to descramble incoming data.

Special logic in the descrambler ensures synchronization with the remote transceiver by searching for IDLE symbols within a window of 4000 bytes (40  $\mu$ s). This window ensures that a maximum packet size of 1514 bytes, allowed by the IEEE 802.3 standard, can be received with no interference. If no IDLE-symbols are detected within this time-period, receive operation is aborted and the descrambler re-starts the synchronization process.

### 3.1.2.5 Alignment

The de-scrambled signal is then aligned into 5-bit code-groups by recognizing the /J/K/ Start-of-Stream Delimiter (SSD) pair at the start of a packet. Once the code-word alignment is determined, it is stored and utilized until the next start of frame.

## 3.1.2.6 5B/4B Decoding

The 5-bit code-groups are translated into 4-bit data nibbles according to the 4B/5B table. The translated data is presented on the RXD[3:0] signal lines. The SSD, /J/K/, is translated to "0101 0101" as the first 2 nibbles of the MAC preamble. Reception of the SSD causes the transceiver to assert the receive data valid signal, indicating that valid data is available on the RXD bus. Successive valid code-groups are translated to data nibbles. Reception of either the End of Stream Delimiter (ESD) consisting of the /T/R/ symbols, or at least two /l/ symbols causes the transceiver to de-assert the carrier sense and receive data valid signals.

**Note:** These symbols are not translated into data.

### 3.1.2.7 Receive Data Valid Signal

The Receive Data Valid signal (RXDV) indicates that recovered and decoded nibbles are being presented on the RXD[3:0] outputs synchronous to RXCLK. RXDV becomes active after the /J/K/ delimiter has been recognized and RXD is aligned to nibble boundaries. It remains active until either the /T/R/ delimiter is recognized or link test indicates failure or SIGDET becomes false.

RXDV is asserted when the first nibble of translated /J/K/ is ready for transfer over the Media Independent Interface (MII mode).

FIGURE 3-3: RELATIONSHIP BETWEEN RECEIVED DATA AND SPECIFIC MII SIGNALS

#### 3.1.2.8 Receiver Errors

During a frame, unexpected code-groups are considered receive errors. Expected code groups are the DATA set (0 through F), and the /T/R/ (ESD) symbol pair. When a receive error occurs, the RXER signal is asserted and arbitrary data is driven onto the RXD[3:0] lines. Should an error be detected during the time that the /J/K/ delimiter is being decoded (bad SSD error), RXER is asserted true and the value '1110' is driven onto the RXD[3:0] lines. Note that the Valid Data signal is not yet asserted when the bad SSD error occurs.

### 3.1.2.9 100M Receive Data Across the MII/RMII Interface

In MII mode, the 4-bit data nibbles are sent to the MII block. These data nibbles are clocked to the controller at a rate of 25 MHz. The controller samples the data on the rising edge of RXCLK. To ensure that the setup and hold requirements are met, the nibbles are clocked out of the transceiver on the falling edge of RXCLK. RXCLK is the 25 MHz output clock for the MII bus. It is recovered from the received data to clock the RXD bus. If there is no received signal, it is derived from the system reference clock (XTAL1/CLKIN).

When tracking the received data, RXCLK has a maximum jitter of 0.8 ns (provided that the jitter of the input clock, XTAL1/CLKIN, is below 100 ps).

In RMII mode, the 2-bit data nibbles are sent to the RMII block. These data nibbles are clocked to the controller at a rate of 50 MHz. The controller samples the data on the rising edge of XTAL1/CLKIN (REF\_CLK). To ensure that the setup and hold requirements are met, the nibbles are clocked out of the transceiver on the falling edge of XTAL1/CLKIN (REF\_CLK).

## 3.1.3 10BASE-T TRANSMIT

Data to be transmitted comes from the MAC layer controller. The 10BASE-T transmitter receives 4-bit nibbles from the MII at a rate of 2.5 MHz and converts them to a 10 Mbps serial data stream. The data stream is then Manchester-encoded and sent to the analog transmitter, which drives a signal onto the twisted pair via the external magnetics.

The 10M transmitter uses the following blocks:

- MII (digital)
- TX 10M (digital)
- 10M Transmitter (analog)
- 10M PLL (analog)

#### 3.1.3.1 10M Transmit Data Across the MII/RMII Interface

The MAC controller drives the transmit data onto the TXD bus. For MII, when the controller has driven TXEN high to indicate valid data, the data is latched by the MII block on the rising edge of TXCLK. The data is in the form of 4-bit wide 2.5 MHz data. For RMII, TXD[1:0] shall transition synchronously with respect to REF\_CLK. When TXEN is asserted, TXD[1:0] are accepted for transmission by the device. TXD[1:0] shall be "00" to indicate idle when TXEN is deasserted. Values of TXD[1:0] other than "00" when TXEN is deasserted are reserved for out-of-band signaling (to be defined). Values other than "00" on TXD[1:0] while TXEN is deasserted shall be ignored by the device. TXD[1:0] shall provide valid data for each REF\_CLK period while TXEN is asserted.

In order to comply with legacy 10BASE-T MAC/Controllers, in half-duplex mode the transceiver loops back the transmitted data, on the receive path. This does not confuse the MAC/Controller since the COL signal is not asserted during this time. The transceiver also supports the SQE (Heartbeat) signal. See Section 3.8.8, "Collision Detect", for more details.

## 3.1.3.2 Manchester Encoding

The 4-bit wide data is sent to the 10M TX block. The nibbles are converted to a 10 Mbps serial NRZI data stream. The 10M PLL locks onto the external clock or internal oscillator and produces a 20 MHz clock. This is used to Manchester encode the NRZ data stream. When no data is being transmitted (TXEN is low), the 10M TX block outputs Normal Link Pulses (NLPs) to maintain communications with the remote link partner.

## 3.1.3.3 10M Transmit Drivers

The Manchester-encoded data is sent to the analog transmitter where it is shaped and filtered before being driven out as a differential signal across the TXP and TXN outputs.

#### 3.1.4 10BASE-T RECEIVE

The 10BASE-T receiver gets the Manchester- encoded analog signal from the cable via the magnetics. It recovers the receive clock from the signal and uses this clock to recover the NRZI data stream. This 10M serial data is converted to 4-bit data nibbles which are passed to the controller via MII at a rate of 2.5 MHz.

This 10M receiver uses the following blocks:

- · Filter and SQUELCH (analog)
- 10M PLL (analog)
- · RX 10M (digital)
- · MII (digital)

### 3.1.4.1 10M Receive Input and Squelch

The Manchester signal from the cable is fed into the transceiver (on inputs RXP and RXN) via 1:1 ratio magnetics. It is first filtered to reduce any out-of-band noise. It then passes through a SQUELCH circuit. The SQUELCH is a set of amplitude and timing comparators that normally reject differential voltage levels below 300 mV and detect and recognize differential voltages above 585 mV.

## 3.1.4.2 Manchester Decoding

The output of the SQUELCH goes to the 10M RX block where it is validated as Manchester encoded data. The polarity of the signal is also checked. If the polarity is reversed (local RXP is connected to RXN of the remote partner and vice versa), the condition is identified and corrected. The reversed condition is indicated by the XPOL bit of the Special Control/Status Indications Register. The 10M PLL is locked onto the received Manchester signal, from which the 20 MHz cock is generated. Using this clock, the Manchester encoded data is extracted and converted to a 10 MHz NRZI data stream. It is then converted from serial to 4-bit wide parallel data.

The 10M RX block also detects valid 10BASE-T IDLE signals - Normal Link Pulses (NLPs) - to maintain the link.

#### 3.1.4.3 10M Receive Data Across the MII/RMII Interface

For MII, the 4-bit data nibbles are sent to the MII block. In MII mode, these data nibbles are valid on the rising edge of the 2.5 MHz RXCLK.

For RMII, the 2-bit data nibbles are sent to the RMII block. In RMII mode, these data nibbles are valid on the rising edge of the RMII REF CLK.

Note: RXDV goes high with the SFD.

#### 3.1.4.4 Jabber Detection

Jabber is a condition in which a station transmits for a period of time longer than the maximum permissible packet length, usually due to a fault condition, which results in holding the TXEN input for a long period. Special logic is used to detect the jabber state and abort the transmission to the line within 45 ms. Once TXEN is deasserted, the logic resets the jabber condition.

As shown in Section 4.2.2, "Basic Status Register", the Jabber Detect bit indicates that a jabber condition was detected.

## 3.2 Auto-Negotiation

The purpose of the auto-negotiation function is to automatically configure the transceiver to the optimum link parameters based on the capabilities of its link partner. Auto-negotiation is a mechanism for exchanging configuration information between two link-partners and automatically selecting the highest performance mode of operation supported by both sides. Auto-negotiation is fully defined in clause 28 of the IEEE 802.3 specification.

Once auto-negotiation has completed, information about the resolved link can be passed back to the controller via the Serial Management Interface (SMI). The results of the negotiation process are reflected in the Speed Indication bits of the PHY Special Control/Status Register, as well as in the Auto Negotiation Link Partner Ability Register. The auto-negotiation protocol is a purely physical layer activity and proceeds independently of the MAC controller.

The advertised capabilities of the transceiver are stored in the Auto Negotiation Advertisement Register. The default advertised by the transceiver is determined by user-defined on-chip signal options.

The following blocks are activated during an auto-negotiation session:

- Auto-negotiation (digital)
- 100M ADC (analog)
- 100M PLL (analog)
- 100M equalizer/BLW/clock recovery (DSP)
- 10M SQUELCH (analog)
- 10M PLL (analog)
- 10M Transmitter (analog)

When enabled, auto-negotiation is started by the occurrence of one of the following events:

- · Hardware reset
- Software reset
- · Power-down reset
- · Link status down
- · Setting the Restart Auto-Negotiate bit of the Basic Control Register

On detection of one of these events, the transceiver begins auto-negotiation by transmitting bursts of Fast Link Pulses (FLP), which are bursts of link pulses from the 10M transmitter. They are shaped as Normal Link Pulses and can pass uncorrupted down CAT-3 or CAT-5 cable. A Fast Link Pulse Burst consists of up to 33 pulses. The 17 odd-numbered pulses, which are always present, frame the FLP burst. The 16 even-numbered pulses, which may be present or absent, contain the data word being transmitted. Presence of a data pulse represents a "1", while absence represents a "0".

The data transmitted by an FLP burst is known as a "Link Code Word." These are defined fully in IEEE 802.3 clause 28. In summary, the transceiver advertises 802.3 compliance in its selector field (the first 5 bits of the Link Code Word). It advertises its technology ability according to the bits set in the Auto Negotiation Advertisement Register.

There are 4 possible matches of the technology abilities. In the order of priority these are:

- · 100M Full Duplex (Highest Priority)
- 100M Half Duplex
- 10M Full Duplex
- 10M Half Duplex (Lowest Priority)

If the full capabilities of the transceiver are advertised (100M, Full Duplex), and if the link partner is capable of 10M and 100M, then auto-negotiation selects 100M as the highest performance mode. If the link partner is capable of half and full duplex modes, then auto-negotiation selects full duplex as the highest performance operation.

Once a capability match has been determined, the link code words are repeated with the acknowledge bit set. Any difference in the main content of the link code words at this time will cause auto-negotiation to re-start. Auto-negotiation will also re-start if not all of the required FLP bursts are received.

The capabilities advertised during auto-negotiation by the transceiver are initially determined by the logic levels latched on the MODE[2:0] configuration straps after reset completes. These configuration straps can also be used to disable auto-negotiation on power-up. Refer to Section 3.7.2, "MODE[2:0]: Mode Configuration" for additional information.

Writing the bits 8 through 5 of the Auto Negotiation Advertisement Register allows software control of the capabilities advertised by the transceiver. Writing the Auto Negotiation Advertisement Register does not automatically re-start autonegotiation. The Restart Auto-Negotiate bit of the Basic Control Register must be set before the new abilities will be advertised. Auto-negotiation can also be disabled via software by clearing the Auto-Negotiation Enable bit of the Basic Control Register.

#### 3.2.1 PARALLEL DETECTION

If the LAN8741A/LAN8741Ai is connected to a device lacking the ability to auto-negotiate (i.e., no FLPs are detected), it is able to determine the speed of the link based on either 100M MLT-3 symbols or 10M Normal Link Pulses. In this case the link is presumed to be half duplex per the IEEE standard. This ability is known as "Parallel Detection." This feature ensures interoperability with legacy link partners. If a link is formed via parallel detection, then the Link Partner Auto-Negotiation Able bit of the Auto Negotiation Expansion Register is cleared to indicate that the Link Partner is not capable of auto-negotiation. The controller has access to this information via the management interface. If a fault occurs during parallel detection, the Parallel Detection Fault bit of Link Partner Auto-Negotiation Able is set.

Auto Negotiation Link Partner Ability Register is used to store the link partner ability information, which is coded in the received FLPs. If the link partner is not auto-negotiation capable, then the Auto Negotiation Link Partner Ability Register is updated after completion of parallel detection to reflect the speed capability of the link partner.

#### 3.2.2 RESTARTING AUTO-NEGOTIATION

Auto-negotiation can be restarted at any time by setting the Restart Auto-Negotiate bit of the Basic Control Register. Auto-negotiation will also restart if the link is broken at any time. A broken link is caused by signal loss. This may occur because of a cable break, or because of an interruption in the signal transmitted by the link partner. Auto-negotiation resumes in an attempt to determine the new link configuration.

If the management entity re-starts auto-negotiation by setting the Restart Auto-Negotiate bit of the Basic Control Register, the LAN8741A/LAN8741Ai will respond by stopping all transmission/receiving operations. Once the break\_link\_timer is completed in the auto-negotiation state-machine (approximately 1250 ms), auto-negotiation will re-start. In this case, the link partner will have also dropped the link due to lack of a received signal, so it too will resume auto-negotiation.

#### 3.2.3 DISABLING AUTO-NEGOTIATION

Auto-negotiation can be disabled by setting the Auto-Negotiation Enable bit of the Basic Control Register to zero. The device will then force its speed of operation to reflect the information in the Basic Control Register (Speed Select bit and Duplex Mode bit). These bits should be ignored when auto-negotiation is enabled.

#### 3.2.4 HALF VS. FULL DUPLEX

Half duplex operation relies on the CSMA/CD (Carrier Sense Multiple Access / Collision Detect) protocol to handle network traffic and collisions. In this mode, the carrier sense signal, CRS, responds to both transmit and receive activity. If data is received while the transceiver is transmitting, a collision results.

In full duplex mode, the transceiver is able to transmit and receive data simultaneously. In this mode, CRS responds only to receive activity. The CSMA/CD protocol does not apply and collision detection is disabled.

## 3.3 HP Auto-MDIX Support

HP Auto-MDIX facilitates the use of CAT-3 (10BASE-T) or CAT-5 (100BASE-TX) media UTP interconnect cable without consideration of interface wiring scheme. If a user plugs in either a direct connect LAN cable, or a cross-over patch cable, as shown in Figure 3-4, the device's Auto-MDIX transceiver is capable of configuring the TXP/TXN and RXP/RXN pins for correct transceiver operation.

The internal logic of the device detects the TX and RX pins of the connecting device. Since the RX and TX line pairs are interchangeable, special PCB design considerations are needed to accommodate the symmetrical magnetics and termination of an Auto-MDIX design.

The Auto-MDIX function can be disabled via the AMDIXCTRL bit in the Special Control/Status Indications Register.

Note:

When operating in 10BASE-T or 100BASE-TX manual modes, the Auto-MDIX crossover time can be extended via the Extend Manual 10/100 Auto-MDIX Crossover Time bit of the EDPD NLP/Crossover Time/EEE Configuration Register. Refer to Section 4.2.12, "EDPD NLP/Crossover Time/EEE Configuration Register" for additional information.

## FIGURE 3-4: DIRECT CABLE CONNECTION VS. CROSS-OVER CABLE CONNECTION

#### 3.4 MAC Interface

The MII/RMII block is responsible for communication with the MAC controller. Special sets of hand-shake signals are used to indicate that valid received/transmitted data is present on the 4 bit receive/transmit bus.

The device must be configured in MII or RMII mode. This is done by specific pin strapping configurations. Refer to Section 3.4.3, "MII vs. RMII Configuration" for information on pin strapping and how the pins are mapped differently.

#### 3.4.1 MII

The MII includes 16 interface signals:

- Transmit data TXD[3:0]
- · Transmit strobe TXEN
- · Transmit clock TXCLK
- · Transmit error TXER/TXD4
- Receive data RXD[3:0]
- · Receive strobe RXDV
- · Receive clock RXCLK
- Receive error RXER/RXD4/PHYAD0
- · Collision indication COL
- · Carrier sense CRS

In MII mode, on the transmit path, the transceiver drives the transmit clock, TXCLK, to the controller. The controller synchronizes the transmit data to the rising edge of TXCLK. The controller drives TXEN high to indicate valid transmit data. The controller drives TXER high when a transmit error is detected.

On the receive path, the transceiver drives both the receive data, RXD[3:0], and the RXCLK signal. The controller clocks in the receive data on the rising edge of RXCLK when the transceiver drives RXDV high. The transceiver drives RXER high when a receive error is detected.

#### 3.4.2 RMII

The device supports the low pin count Reduced Media Independent Interface (RMII) intended for use between Ethernet transceivers and switch ASICs. Under IEEE 802.3, an MII comprised of 16 pins for data and control is defined. In devices incorporating many MACs or transceiver interfaces such as switches, the number of pins can add significant cost as the port counts increase. RMII reduces this pin count while retaining a management interface (MDIO/MDC) that is identical to MII.

The RMII interface has the following characteristics:

- It is capable of supporting 10 Mbps and 100 Mbps data rates
- A single clock reference is used for both transmit and receive
- It provides independent 2-bit (di-bit) wide transmit and receive data paths
- · It uses LVCMOS signal levels, compatible with common digital CMOS ASIC processes

The RMII includes the following interface signals (1 optional):

- Transmit data TXD[1:0]
- · Transmit strobe TXEN
- Receive data RXD[1:0]
- · Receive error RXER (Optional)
- · Carrier sense CRS DV
- · Reference Clock (RMII references usually define this signal as REF\_CLK)

## 3.4.2.1 CRS DV - Carrier Sense/Receive Data Valid

The CRS\_DV is asserted by the device when the receive medium is non-idle. CRS\_DV is asserted asynchronously on detection of carrier due to the criteria relevant to the operating mode. In 10BASE-T mode when squelch is passed, or in 100BASE-TX mode when 2 non-contiguous zeroes in 10 bits are detected, the carrier is said to be detected.

Loss of carrier shall result in the deassertion of CRS\_DV synchronous to the cycle of REF\_CLK which presents the first di-bit of a nibble onto RXD[1:0] (i.e., CRS\_DV is deasserted only on nibble boundaries). If the device has additional bits to be presented on RXD[1:0] following the initial deassertion of CRS\_DV, then the device shall assert CRS\_DV on cycles of REF\_CLK which present the second di-bit of each nibble and de-assert CRS\_DV on cycles of REF\_CLK which present the first di-bit of a nibble. The result is, starting on nibble boundaries, CRS\_DV toggles at 25 MHz in 100 Mbps mode and 2.5 MHz in 10 Mbps mode when CRS ends before RXDV (i.e., the FIFO still has bits to transfer when the carrier event ends). Therefore, the MAC can accurately recover RXDV and CRS.

During a false carrier event, CRS\_DV shall remain asserted for the duration of carrier activity. The data on RXD[1:0] is considered valid once CRS\_DV is asserted. However, since the assertion of CRS\_DV is asynchronous relative to REF\_CLK, the data on RXD[1:0] shall be "00" until proper receive signal decoding takes place.

## 3.4.2.2 Reference Clock (REF\_CLK)

The RMII REF\_CLK is a continuous clock that provides the timing reference for CRS\_DV, RXD[1:0], TXEN, TXD[1:0] and RXER. The device uses REF\_CLK as the network clock such that no buffering is required on the transmit data path. However, on the receive data path, the receiver recovers the clock from the incoming data stream, and the device uses elasticity buffering to accommodate for differences between the recovered clock and the local REF\_CLK.

### 3.4.3 MII VS. RMII CONFIGURATION

The device must be configured to support the MII or RMII bus for connectivity to the MAC. This configuration is done via the <u>RMIISEL</u> configuration strap. MII or RMII mode selection is configured based on the strapping of the <u>RMIISEL</u> configuration strap as described in <u>Section 3.7.3</u>, "RMIISEL: <u>MII/RMII Mode Configuration</u>".

Most of the MII and RMII pins are multiplexed. Table 3-2, "MII/RMII Signal Mapping" describes the relationship of the related device pins to the MII and RMII mode signal names.

TABLE 3-2: MII/RMII SIGNAL MAPPING

Pin Name	MII Mode	RMII Mode
TXD0	TXD0	TXD0
TXD1	TXD1	TXD1
TXEN	TXEN	TXEN
RXER/ RXD4/ <u>PHYAD0</u>	RXER	RXER (see Note 1)
COL/CRS_DV/MODE2	COL	CRS_DV
RXD0/MODE0	RXD0	RXD0
RXD1/MODE1	RXD1	RXD1
TXD2	TXD2	(see Note 2)
TXD3	TXD3	(see Note 2)
nINT/TXER/TXD4	TXER/ TXD4	
CRS	CRS	
RXDV	RXDV	
RXD2/ <u>RMIISEL</u>	RXD2	
RXD3/ <u>PHYAD2</u>	RXD3	
TXCLK	TXCLK	
RXCLK/ <u>PHYAD1</u>	RXCLK	
XTAL1/CLKIN	XTAL1/CLKIN	REF_CLK

**Note 1:** The RXER signal is optional on the RMII bus. This signal is required by the transceiver, but it is optional for the MAC. The MAC can choose to ignore or not use this signal.

<sup>2:</sup> In RMII mode, this pin needs to be tied to VSS.

## 3.5 Serial Management Interface (SMI)

The Serial Management Interface is used to control the device and obtain its status. This interface supports registers 0 through 6 as required by clause 22 of the 802.3 standard, as well as "vendor-specific" registers 16 to 31 allowed by the specification. Device registers are detailed in Chapter 4, "Register Descriptions".

At the system level, SMI provides 2 signals: MDIO and MDC. The MDC signal is an aperiodic clock provided by the Station Management Controller (SMC). MDIO is a bi-directional data SMI input/output signal that receives serial data (commands) from the controller SMC and sends serial data (status) to the SMC. The minimum time between edges of the MDC is 160 ns. There is no maximum time between edges. The minimum cycle time (time between two consecutive rising or two consecutive falling edges) is 400 ns. These modest timing requirements allow this interface to be easily driven by the I/O port of a microcontroller.

The data on the MDIO line is latched on the rising edge of the MDC. The frame structure and timing of the data is shown in Figure 3-5 and Figure 3-6. The timing relationships of the MDIO signals are further described in Section 5.6.5, "SMI Timing".

#### FIGURE 3-5: MDIO TIMING AND FRAME STRUCTURE - READ CYCLE

## FIGURE 3-6: MDIO TIMING AND FRAME STRUCTURE - WRITE CYCLE

## 3.6 Interrupt Management

The device management interface supports an interrupt capability that is not a part of the IEEE 802.3 specification. This interrupt capability generates an active low asynchronous interrupt signal on the nINT output whenever certain events are detected as setup by the Interrupt Mask Register.

The device's interrupt system provides two modes, a Primary interrupt mode and an Alternative interrupt mode. Both systems will assert the nINT pin low when the corresponding mask bit is set. These modes differ only in how they deassert the nINT interrupt output. These modes are detailed in the following subsections.

**Note:** The Primary interrupt mode is the default interrupt mode after a power-up or hard reset. The Alternative interrupt mode requires setup after a power-up or hard reset.

#### 3.6.1 PRIMARY INTERRUPT SYSTEM

The Primary interrupt system is the default interrupt mode (ALTINT bit of the Mode Control/Status Register is "0"). The Primary interrupt system is always selected after power-up or hard reset. In this mode, to set an interrupt, set the corresponding mask bit in the Interrupt Mask Register (see Table 3-3). Then when the event to assert nINT is true, the nINT output will be asserted. When the corresponding event to deassert nINT is true, then the nINT will be de-asserted.

TABLE 3-3: INTERRUPT MANAGEMENT TABLE

Mask	Interrupt Source Flag		nterrupt Source Flag Interrupt Source		Event to Assert nINT	Event to De-Assert nINT
30.7	29.7	ENERGYON	17.1	ENERGYON	Rising 17.1 (see Note 1)	Falling 17.1 or Reading register 29
30.6	29.6	Auto-Negotiation Complete	1.5	Auto-Negotiate Complete	Rising 1.5	Falling 1.5 or Reading register 29
30.5	29.5	Remote Fault Detected	1.4	Remote Fault	Rising 1.4	Falling 1.4, or Reading register 1 or Reading register 29
30.4	29.4	Link Down	1.2	Link Status	Falling 1.2	Reading register 1 or Reading register 29
30.3	29.3	Auto-Negotiation LP Acknowledge	5.14	Acknowledge	Rising 5.14	Falling 5.14 or Reading register 29
30.2	29.2	Parallel Detection Fault	6.4	Parallel Detection Fault	Rising 6.4	Falling 6.4 or Reading register 6, or Reading register 29, or Re-Auto Negotiate or Link down
30.1	29.1	Auto-Negotiation Page Received	6.1	Page Received	Rising 6.1	Falling 6.1 or Reading register 6, or Reading register 29, or Re-Auto Negotiate, or Link down.

**Note 1:** If the mask bit is enabled and nINT has been de-asserted while ENERGYON is still high, nINT will assert for 256 ms, approximately one second after ENERGYON goes low when the Cable is unplugged. To prevent an unexpected assertion of nINT, the ENERGYON interrupt mask should always be cleared as part of the ENERGYON interrupt service routine.

**Note:** The ENERGYON bit in the Mode Control/Status Register is defaulted to a '1' at the start of the signal acquisition process, therefore the INT7 bit in the Interrupt Mask Register will also read as a '1' at power-up. If no signal is present, then both ENERGYON and INT7 will clear within a few milliseconds.

#### 3.6.2 ALTERNATE INTERRUPT SYSTEM

The Alternate interrupt system is enabled by setting the ALTINT bit of the Mode Control/Status Register to "1". In this mode, to set an interrupt, set the corresponding bit of the in the Mask Register 30, (see Table 3-4). To Clear an interrupt, either clear the corresponding bit in the Interrupt Mask Register to deassert the nINT output, or clear the interrupt source, and write a '1' to the corresponding Interrupt Source Flag. Writing a '1' to the Interrupt Source Flag will cause the state machine to check the Interrupt Source to determine if the Interrupt Source Flag should clear or stay as a '1'. If the Condition to deassert is true, then the Interrupt Source Flag is cleared and nINT is also deasserted. If the Condition to deassert is false, then the Interrupt Source Flag remains set, and the nINT remains asserted.

For example, setting the INT7 bit in the Interrupt Mask Register will enable the ENERGYON interrupt. After a cable is plugged in, the ENERGYON bit in the Mode Control/Status Register goes active and nINT will be asserted low. To deassert the nINT interrupt output, either clear the ENERGYON bit in the Mode Control/Status Register by removing the cable and then writing a '1' to the INT7 bit in the Interrupt Mask Register, *OR* clear the INT7 mask (bit 7 of the Interrupt Mask Register).

TABLE 3-4: ALTERNATIVE INTERRUPT SYSTEM MANAGEMENT TABLE

Mask	Interrupt Source Flag		Interrupt Source		Event to Assert nINT	Condition to DeAssert	Bit to Clear nINT
30.7	29.7	ENERGYON	17.1	ENERGYON	Rising 17.1	17.1 low	29.7
30.6	29.6	Auto-Negotiation Complete	1.5	Auto-Negotiate Complete	Rising 1.5	1.5 low	29.6
30.5	29.5	Remote Fault Detected	1.4	Remote Fault	Rising 1.4	1.4 low	29.5
30.4	29.4	Link Down	1.2	Link Status	Falling 1.2	1.2 high	29.4
30.3	29.3	Auto-Negotiation LP Acknowledge	5.14	Acknowledge	Rising 5.14	5.14 low	29.3
30.2	29.2	Parallel Detection Fault	6.4	Parallel Detec- tion Fault	Rising 6.4	6.4 low	29.2
30.1	29.1	Auto-Negotiation Page Received	6.1	Page Received	Rising 6.1	6.1 low	29.1

**Note:** The ENERGYON bit in the Mode Control/Status Register is defaulted to a '1' at the start of the signal acquisition process, therefore the INT7 bit in the Interrupt Mask Register will also read as a '1' at power-up. If no signal is present, then both ENERGYON and INT7 will clear within a few milliseconds.

## 3.7 Configuration Straps

Configuration straps allow various features of the device to be automatically configured to user defined values. Configuration straps are latched upon Power-On Reset (POR) and pin reset (nRST). Configuration straps include internal resistors in order to prevent the signal from floating when unconnected. If a particular configuration strap is connected to a load, an external pull-up or pull-down resistor should be used to augment the internal resistor to ensure that it reaches the required voltage level prior to latching. The internal resistor can also be overridden by the addition of an external resistor.

Note:

The system designer must guarantee that configuration strap pins meet the timing requirements specified in Section 5.6.2, "Power-On nRST & Configuration Strap Timing". If configuration strap pins are not at the correct voltage level prior to being latched, the device may capture incorrect strap values.

Note:

When externally pulling configuration straps high, the strap should be tied to VDDIO, except for <u>REGOFF</u> and nINTSEL which should be tied to VDD2A.

## 3.7.1 PHYAD[2:0]: PHY ADDRESS CONFIGURATION

The <u>PHYAD[2:0]</u> configuration straps are driven high or low to give each PHY a unique address. This address is latched into an internal register at the end of a hardware reset (default = 000b). In a multi-transceiver application (such as a repeater), the controller is able to manage each transceiver via the unique address. Each transceiver checks each management data frame for a matching address in the relevant bits. When a match is recognized, the transceiver responds to that particular frame. The PHY address is also used to seed the scrambler. In a multi-transceiver application, this ensures that the scramblers are out of synchronization and disperses the electromagnetic radiation across the frequency spectrum.

The device's SMI address may be configured using hardware configuration to any value between 0 and 7. The user can configure the PHY address using Software Configuration if an address greater than 7 is required. The PHY address can be written (after SMI communication at some address is established) using the PHYAD bits of the Special Modes Register. The PHYAD[2:0] configuration straps are multiplexed with other signals as shown in Table 3-5.

TABLE 3-5: PIN NAMES FOR ADDRESS BITS

Address Bit	Pin Name
PHYAD[0]	RXER/RXD4/PHYAD0
PHYAD[1]	RXCLK/ <u>PHYAD1</u>
PHYAD[2]	RXD3/ <u>PHYAD2</u>

## 3.7.2 MODE[2:0]: MODE CONFIGURATION

The MODE[2:0] configuration straps control the configuration of the 10/100 digital block. When the nRST pin is deasserted, the register bit values are loaded according to the MODE[2:0] configuration straps. The 10/100 digital block is then configured by the register bit values. When a soft reset occurs via the Soft Reset bit of the Basic Control Register, the configuration of the 10/100 digital block is controlled by the register bit values and the MODE[2:0] configuration straps have no affect.

The device's mode may be configured using the hardware configuration straps as summarized in Table 3-6. The user may configure the transceiver mode by writing the SMI registers.

TABLE 3-6: MODE[2:0] BUS

		Default Register Bit Values		
MODE[2:0]	Mode Definitions	Register 0	Register 4	
		[13,12,10,8]	[8,7,6,5]	
000	10BASE-T Half Duplex. Auto-negotiation disabled.	0000	N/A	
001	10BASE-T Full Duplex. Auto-negotiation disabled.	0001	N/A	
010	100BASE-TX Half Duplex. Auto-negotiation disabled. CRS is active during Transmit & Receive.	1000	N/A	
011	100BASE-TX Full Duplex. Auto-negotiation disabled. CRS is active during Receive.	1001	N/A	
100	100BASE-TX Half Duplex is advertised. Auto-negotiation enabled. CRS is active during Transmit & Receive.	1100	0100	
101	Repeater mode. Auto-negotiation enabled. 100BASE-TX Half Duplex is advertised. CRS is active during Receive.	1100	0100	
110	Power-Down mode. In this mode the transceiver will wake-up in Power-Down mode. The transceiver cannot be used when the MODE[2:0] bits are set to this mode. To exit this mode, the MODE bits in Register 18.7:5 (see Section 4.2.14, "Special Modes Register") must be configured to some other value and a soft reset must be issued.	N/A	N/A	
111	All capable. Auto-negotiation enabled.	X10X	1111	

The MODE[2:0] hardware configuration pins are multiplexed with other signals as shown in Table 3-7.

TABLE 3-7: PIN NAMES FOR MODE BITS

MODE Bit	Pin Name
MODE[0]	RXD0/MODE0
MODE[1]	RXD1/MODE1
MODE[2]	COL/CRS_DV/MODE2

### 3.7.3 RMIISEL: MII/RMII MODE CONFIGURATION

MII or RMII mode selection is latched on the rising edge of the internal reset (nRST) based on the strapping of the RMIISEL configuration strap. The default mode is MII (via the internal pull-down resistor). To select RMII mode, pull the RMIISEL configuration strap high with an external resistor to VDDIO.

When the nRST pin is deasserted, the MIIMODE bit of the Special Modes Register is loaded according to the RMIISEL configuration strap. The mode is reflected in the MIIMODE bit of the Special Modes Register.

Refer to Section 3.4, "MAC Interface" for additional information on MII and RMII modes.

#### 3.7.4 REGOFF: INTERNAL +1.2 V REGULATOR CONFIGURATION

The incorporation of flexPWR technology provides the ability to disable the internal +1.2 V regulator. When the regulator is disabled, an external +1.2 V must be supplied to the VDDCR pin. Disabling the internal +1.2 V regulator makes it possible to reduce total system power, since an external switching regulator with greater efficiency (versus the internal linear regulator) can be used to provide +1.2 V to the transceiver circuitry.

Note:

Because the <u>REGOFF</u> configuration strap shares functionality with the LED1 pin, proper consideration must also be given to the LED polarity. Refer to <u>Section 3.8.1</u>, "<u>LEDs</u>" for additional information on the relation between REGOFF and the LED1 polarity.

## 3.7.4.1 Disabling the Internal +1.2 V Regulator

To disable the  $\pm 1.2$  V internal regulator, a pull-up strapping resistor should be connected from the <u>REGOFF</u> configuration strap to VDD2A. At power-on, after both VDDIO and VDD2A are within specification, the transceiver will sample <u>REGOFF</u> to determine whether the internal regulator should turn on. If the pin is sampled at a voltage greater than  $V_{IH}$ , then the internal regulator is disabled and the system must supply  $\pm 1.2$  V to the VDDCR pin. The VDDIO voltage must be at least 80% of the operating voltage level (1.44 V when operating at 1.8 V, 2.0 V when operating at 2.5 V, 2.64 V when operating at 3.3 V) before voltage is applied to VDDCR. As described in <u>Section 3.7.4.2</u>, when <u>REGOFF</u> is left floating or connected to VSS, the internal regulator is enabled and the system is not required to supply  $\pm 1.2$  V to the VDDCR pin.

### 3.7.4.2 Enabling the Internal +1.2 V Regulator

The +1.2 V for VDDCR is supplied by the on-chip regulator unless the transceiver is configured for the regulator off mode using the  $\underline{REGOFF}$  configuration strap as described in  $\underline{Section 3.7.4.1}$ . By default, the internal +1.2 V regulator is enabled when  $\underline{REGOFF}$  is floating (due to the internal pull-down resistor). During power-on, if  $\underline{REGOFF}$  is sampled below  $V_{IL}$ , then the internal +1.2 V regulator will turn on and operate with power from the VDD2A pin.

## 3.7.5 nINTSEL: nINT/TXER/TXD4 CONFIGURATION

The nINT, TXER, and TXD4 functions share a common pin. There are two functional modes for this pin, the TXER/TXD4 mode and nINT (interrupt) mode. The <u>nINTSEL</u> configuration strap is latched at POR and on the rising edge of the nRST. By default, nINTSEL is configured for nINT mode via the internal pull-up resistor.

Note: In order to utilize EEE, the nINT/TXER/TXD4 pin must be configured as TXER/TXD4.

Note:

Because the <u>nINTSEL</u> configuration strap shares functionality with the LED2 pin, proper consideration must also be given to the LED polarity. Refer to <u>Section 3.8.1.2</u>, "<u>nINTSEL</u> and <u>LED2 Polarity Selection</u>" for additional information on the relation between <u>nINTSEL</u> and the LED2 polarity.

### 3.8 Miscellaneous Functions

#### 3.8.1 LEDS

Two LED signals are provided as a convenient means to indicate the transceiver's mode of operation. All LED signals are either active high or active low as described in Section 3.8.1.1, "REGOFF and LED1 Polarity Selection" and Section 3.8.1.2, "nINTSEL and LED2 Polarity Selection".

The LED1 output is driven active whenever the device detects a valid link, and blinks when CRS is active (high) indicating activity.

The LED2 output is driven active when the operating speed is 100 Mbps. This LED will go inactive when the operating speed is 10 Mbps or during line isolation.

Note: When pulling the LED1 and LED2 pins high, they must be tied to VDD2A, NOT VDDIO.

## 3.8.1.1 REGOFF and LED1 Polarity Selection

The <u>REGOFF</u> configuration strap is shared with the LED1 pin. The LED1 output will automatically change polarity based on the presence of an external pull-up resistor. If the LED1 pin is pulled high to VDD2A by an external pull-up resistor to select a logical high for <u>REGOFF</u>, then the LED1 output will be active low. If the LED1 pin is pulled low by the internal pull-down resistor to select a logical low for <u>REGOFF</u>, the LED1 output will then be an active high output. Figure 3-7 details the LED1 polarity for each <u>REGOFF</u> configuration.

### FIGURE 3-7: LED1/REGOFF POLARITY CONFIGURATION

**Note:** Refer to Section 3.7.4, "REGOFF: Internal +1.2 V Regulator Configuration" for additional information on the <u>REGOFF</u> configuration strap.

## 3.8.1.2 <u>nINTSEL</u> and LED2 Polarity Selection

The <u>nINTSEL</u> configuration strap is shared with the LED2 pin. The LED2 output will automatically change polarity based on the presence of an external pull-down resistor. If the LED2 pin is pulled high to VDD2A to select a logical high for <u>nINTSEL</u>, then the LED2 output will be active low. If the LED2 pin is pulled low by an external pull-down resistor to select a logical low for <u>nINTSEL</u>, the LED2 output will then be an active high output. Figure 3-8 details the LED2 polarity for each <u>nINTSEL</u> configuration.

FIGURE 3-8: LED2/<u>nINTSEL</u> POLARITY CONFIGURATION

**Note:** Refer to Section 3.7.5, "nINTSEL: nINT/TXER/TXD4 Configuration" for additional information on the <u>nINT-SEL</u> configuration strap.

#### 3.8.2 VARIABLE VOLTAGE I/O

The device's digital I/O pins are variable voltage, allowing them to take advantage of low power savings from shrinking technologies. These pins can operate from a low I/O voltage of  $\pm 1.8$  V up to  $\pm 3.3$  V. The applied I/O voltage must maintain its value with a tolerance of  $\pm 10\%$ . Varying the voltage up or down after the transceiver has completed power-on reset can cause errors in the transceiver operation. Refer to Chapter 5, "Operational Characteristics" for additional information.

Note: Input signals must not be driven high before power is applied to the device.

#### 3.8.3 POWER-DOWN MODES

There are two device power-down modes: General Power-Down Mode and Energy Detect Power-Down Mode. These modes are described in the following subsections.

### 3.8.3.1 General Power-Down

This power-down mode is controlled via the Power Down bit of the Basic Control Register. In this mode, the entire transceiver (except the management interface) is powered-down and remains in this mode as long as the Power Down bit is "1". When the Power Down bit is cleared, the transceiver powers up and is automatically reset.

### 3.8.3.2 Energy Detect Power-Down (EDPD)

This power-down mode is activated by setting the EDPWRDOWN bit of the Mode Control/Status Register. In this mode, when no energy is present on the line the transceiver is powered down (except for the management interface, the SQUELCH circuit, and the ENERGYON logic). The ENERGYON logic is used to detect the presence of valid energy from 100BASE-TX, 10BASE-T, or Auto-negotiation signals.

In this mode, when the ENERGYON bit of the Mode Control/Status Register is low, the transceiver is powered-down and nothing is transmitted. When energy is received via link pulses or packets, the ENERGYON bit goes high and the transceiver powers-up. The device automatically resets into the state prior to power-down and asserts the nINT interrupt if the ENERGYON interrupt is enabled in the Interrupt Mask Register. The first and possibly the second packet to activate ENERGYON may be lost.

When the EDPWRDOWN bit of the Mode Control/Status Register is low, energy detect power-down is disabled.

When in EDPD mode, the device's NLP characteristics may be modified. The device can be configured to transmit NLPs in EDPD via the EDPD TX NLP Enable bit of the EDPD NLP/Crossover Time/EEE Configuration Register. When enabled, the TX NLP time interval is configurable via the EDPD TX NLP Interval Timer Select field of the EDPD NLP/Crossover Time/EEE Configuration Register. When in EDPD mode, the device can also be configured to wake on the reception of one or two NLPs. Setting the EDPD RX Single NLP Wake Enable bit of the EDPD NLP/Crossover Time/EEE Configuration Register will enable the device to wake on reception of a single NLP. If the EDPD RX Single NLP Wake Enable bit is cleared, the maximum interval for detecting reception of two NLPs to wake from EDPD is configurable via the EDPD RX NLP Max Interval Detect Select field of the EDPD NLP/Crossover Time/EEE Configuration Register.

#### 3.8.4 ENERGY EFFICIENT ETHERNET

The device supports IEEE 802.3az Energy Efficient Ethernet (EEE). The EEE functionality is enabled/disabled via the PHY Energy Efficient Ethernet Enable (PHYEEEEN) bit of the EDPD NLP/Crossover Time/EEE Configuration Register. Energy Efficient Ethernet is disabled by default. In order for EEE to be utilized, the following conditions must be met:

- The device must configured in MII mode (RMIISEL configuration strap low)
- The nINT/TXER/TXD4 pin must be configured as TXER/TXD4 (nINTSEL configuration strap low)
- EEE functionality must be enabled via the PHY Energy Efficient Ethernet Enable (PHYEEEEN) bit of the EDPD NLP/Crossover Time/EEE Configuration Register
- The 100BASE-TX EEE bit of the MMD EEE Advertisement Register must be set
- The selected MAC and link-partner must support and be configured for EEE operation
- · The device and link-partner must link in 100BASE-TX full-duplex mode

The value of the PHY Energy Efficient Ethernet Enable (PHYEEEEN) bit affects the default values of the following register bits:

- 100BASE-TX EEE bit of the MMD EEE Capability Register
- 100BASE-TX EEE bit of the MMD EEE Advertisement Register

Note: EEE cannot be used in RMII mode.

### 3.8.5 ISOLATE MODE

The device data paths may be electrically isolated from the MII/RMII interface by setting the Isolate bit of the Basic Control Register to "1". In isolation mode, the transceiver does not respond to the TXD, TXEN and TXER inputs, but does respond to management transactions.

Isolation provides a means for multiple transceivers to be connected to the same MII/RMII interface without contention. By default, the transceiver is not isolated (on power-up (Isolate = 0).

#### 3.8.6 RESETS

The device provides two forms of reset: hardware and software. The device registers are reset by both hardware and software resets. Select register bits, indicated as "NASR" in the register definitions, are not cleared by a software reset. The registers are not reset by the power-down modes described in Section 3.8.3.

**Note:** For the first 16 μs after coming out of reset, the MII/RMII interface will run at 2.5 MHz. After this time, it will switch to 25 MHz if auto-negotiation is enabled.

#### 3.8.6.1 Hardware Reset

A hardware reset is asserted by driving the nRST input pin low. When driven, nRST should be held low for the minimum time detailed in Section 5.6.2, "Power-On nRST & Configuration Strap Timing" to ensure a proper transceiver reset. During a hardware reset, an external clock *must* be supplied to the XTAL1/CLKIN signal.

Note: A hardware reset (nRST assertion) is required following power-up. Refer to Section 5.6.2, "Power-On nRST & Configuration Strap Timing" for additional information.

#### 3.8.6.2 Software Reset

A Software reset is activated by setting the Soft Reset bit of the Basic Control Register to "1". All registers bits, except those indicated as "NASR" in the register definitions, are cleared by a Software reset. The Soft Reset bit is self-clearing. Per the IEEE 802.3u standard, clause 22 (22.2.4.1.1) the reset process will be completed within 0.5 s from the setting of this bit.

## 3.8.7 CARRIER SENSE

The carrier sense (CRS) is output on the CRS pin in MII mode, and the CRS\_DV pin in RMII mode. CRS is a signal defined by the MII specification in the IEEE 802.3u standard. The device asserts CRS based only on receive activity whenever the transceiver is either in repeater mode or full-duplex mode. Otherwise the transceiver asserts CRS based on either transmit or receive activity.

The carrier sense logic uses the encoded, unscrambled data to determine carrier activity status. It activates carrier sense with the detection of 2 non-contiguous zeros within any 10 bit span. Carrier sense terminates if a span of 10 consecutive ones is detected before a /J/K/ Start-of Stream Delimiter pair. If an SSD pair is detected, carrier sense is asserted until either /T/R/ End–of-Stream Delimiter pair or a pair of IDLE symbols is detected. Carrier is negated after the /T/ symbol or the first IDLE. If /T/ is not followed by /R/, then carrier is maintained. Carrier is treated similarly for IDLE followed by some non-IDLE symbol.

#### 3.8.8 COLLISION DETECT

A collision is the occurrence of simultaneous transmit and receive operations. The COL output is asserted to indicate that a collision has been detected. COL remains active for the duration of the collision. COL is changed asynchronously to both RXCLK and TXCLK. The COL output becomes inactive during full duplex mode.

The COL may be tested by setting the Collision Test bit of the Basic Control Register to "1". This enables the collision test. COL will be asserted within 512 bit times of TXEN rising and will be de-asserted within 4 bit times of TXEN falling.

#### 3.8.9 LINK INTEGRITY TEST

The device performs the link integrity test as outlined in the IEEE 802.3u (clause 24-15) Link Monitor state diagram. The link status is multiplexed with the 10 Mbps link status to form the Link Status bit in the Basic Status Register and to drive the LINK LED (LED1).

The DSP indicates a valid MLT-3 waveform present on the RXP and RXN signals as defined by the ANSI X3.263 TP-PMD standard, to the Link Monitor state-machine, using the internal DATA\_VALID signal. When DATA\_VALID is asserted, the control logic moves into a Link-Ready state and waits for an enable from the auto-negotiation block. When received, the Link-Up state is entered, and the Transmit and Receive logic blocks become active. Should auto-negotiation be disabled, the link integrity logic moves immediately to the Link-Up state when the DATA\_VALID is asserted.

To allow the line to stabilize, the link integrity logic will wait a minimum of 330 ms from the time DATA\_VALID is asserted until the Link-Ready state is entered. Should the DATA\_VALID input be negated at any time, this logic will immediately negate the Link signal and enter the Link-Down state.

When the 10/100 digital block is in 10BASE-T mode, the link status is derived from the 10BASE-T receiver logic.

#### 3.8.10 LOOPBACK OPERATION

The device may be configured for near-end loopback and far loopback. These loopback modes are detailed in the following subsections.

#### 3.8.10.1 Near-end Loopback

Near-end loopback mode sends the digital transmit data back out the receive data signals for testing purposes, as indicated by the blue arrows in Figure 3-9. The near-end loopback mode is enabled by setting the Loopback bit of the Basic Control Register to "1". A large percentage of the digital circuitry is operational in near-end loopback mode because data is routed through the PCS and PMA layers into the PMD sublayer before it is looped back. The COL signal will be inactive in this mode, unless Collision Test is enabled in the Basic Control Register. The transmitters are powered down regardless of the state of TXEN. Refer to Section 5.6.3.1, "100 Mbps Internal Loopback MII Timing" for additional loopback timing information.

FIGURE 3-9: NEAR-END LOOPBACK BLOCK DIAGRAM

#### 3.8.10.2 Far Loopback

Far loopback is a special test mode for MDI (analog) loopback as indicated by the blue arrows in Figure 3-10. The far loopback mode is enabled by setting the FARLOOPBACK bit of the Mode Control/Status Register to "1". In this mode, data that is received from the link partner on the MDI is looped back out to the link partner. The digital interface signals on the local MAC interface are isolated.

**Note:** This special test mode is only available when operating in RMII mode.

#### FIGURE 3-10: FAR LOOPBACK BLOCK DIAGRAM

#### 3.8.10.3 Connector Loopback

The device maintains reliable transmission over very short cables and can be tested in a connector loopback as shown in Figure 3-11. An RJ45 loopback cable can be used to route the transmit signals from the output of the transformer back to the receiver inputs. The loopback works at both 10 and 100 Mbps.

#### FIGURE 3-11: CONNECTOR LOOPBACK BLOCK DIAGRAM

#### 3.9 Application Diagrams

This section provides typical application diagrams for the following:

- · Simplified System Level Application Diagram
- Power Supply Diagram (1.2 V Supplied by Internal Regulator)
- Power Supply Diagram (1.2 V Supplied by External Source)
- Twisted-Pair Interface Diagram (Single Power Supply)
- Twisted-Pair Interface Diagram (Dual Power Supplies)

#### FIGURE 3-16: TWISTED-PAIR INTERFACE DIAGRAM (DUAL POWER SUPPLIES)

#### 4.0 REGISTER DESCRIPTIONS

This chapter describes the various Control and Status Registers (CSRs) and MDIO Manageable Device (MMD) Registers. The CSRs follow the IEEE 802.3 (clause 22.2.4) management register set. The MMD registers adhere to the *IEEE 802.3-2008 45.2 MDIO Interface Registers* specification. All functionality and bit definitions comply with these standards. The IEEE 802.3 specified register index (in decimal) is included with each CSR definition, allowing for addressing of these registers via the Serial Management Interface (SMI) protocol. MMD registers are accessed indirectly via the MMD Access Control Register and MMD Access Address/Data Register CSRs.

#### 4.1 Register Nomenclature

Table 4-1 describes the register bit attribute notation used throughout this document.

TABLE 4-1: REGISTER BIT TYPES

Register Bit Type Notation	Register Bit Description
R	Read: A register or bit with this attribute can be read.
W	Write: A register or bit with this attribute can be written.
RO	Read only: Writes have no effect.
WO	Write only: If a register or bit is write-only, reads will return unspecified data.
WC	Write One to Clear: Writing a one clears the value. Writing a zero has no effect
WAC	Write Anything to Clear: Writing anything clears the value.
RC	Read to Clear: Contents is cleared after the read. Writes have no effect.
LL	Latch Low: Clear on read of register.
LH	Latch High: Clear on read of register.
SC	<b>Self-Clearing:</b> Contents are self-cleared after the being set. Writes of zero have no effect. Contents can be read.
SS	<b>Self-Setting:</b> Contents are self-setting after being cleared. Writes of one have no effect. Contents can be read.
RO/LH	<b>Read Only, Latch High:</b> Bits with this attribute will stay high until the bit is read. After it is read, the bit will either remain high if the high condition remains, or will go low if the high condition has been removed. If the bit has not been read, the bit will remain high regardless of a change to the high condition. This mode is used in some Ethernet PHY registers.
NASR	Not Affected by Software Reset: The state of NASR bits do not change on assertion of a software reset.
RESERVED	<b>Reserved Field:</b> Reserved fields must be written with zeros to ensure future compatibility. The value of reserved bits is not guaranteed on a read.

Many of these register bit notations can be combined. Some examples of this are shown below:

- R/W: Can be written. Will return current setting on a read.
- R/WAC: Will return current setting on a read. Writing anything clears the bit.

#### 4.2 Control and Status Registers

Table 4-2 provides a list of supported registers. Register details, including bit definitions, are provided in the proceeding subsections.

TABLE 4-2: SMI REGISTER MAP

Register Index (Decimal)	Register Name	Group
0	Basic Control Register	Basic
1	Basic Status Register	Basic
2	PHY Identifier 1 Register	Extended
3	PHY Identifier 2 Register	Extended
4	Auto Negotiation Advertisement Register	Extended
5	Auto Negotiation Link Partner Ability Register	Extended
6	Auto Negotiation Expansion Register	Extended
7	Auto Negotiation Next Page TX Register	Extended
8	Auto Negotiation Next Page RX Register	Extended
13	MMD Access Control Register	Extended
14	MMD Access Address/Data Register	Extended
16	EDPD NLP/Crossover Time/EEE Configuration Register	Vendor-specific
17	Mode Control/Status Register	Vendor-specific
18	Special Modes Register	Vendor-specific
26	Symbol Error Counter Register	Vendor-specific
27	Special Control/Status Indications Register	Vendor-specific
29	Interrupt Source Flag Register	Vendor-specific
30	Interrupt Mask Register	Vendor-specific
31	PHY Special Control/Status Register	Vendor-specific

#### 4.2.1 BASIC CONTROL REGISTER

Index (In Decimal): 0 Size: 16 bits

Bits	Description	Туре	Default
15	Soft Reset 1 = Software reset. Bit is self-clearing. When setting this bit do not set other bits in this register.	R/W SC	0b
	Note: The configuration (as described in Section 3.7.2, "MODE[2:0]: Mode Configuration") is set from the register bit values, and not from the mode pins.		
14	Loopback 0 = Normal operation 1 = Loopback mode	R/W	0b
13	Speed Select 0 = 10 Mbps 1 = 100 Mbps  Note: Ignored if auto-negotiation is enabled (0.12 = 1).	R/W	(see Note 1)
12	Note: Ignored if auto-negotiation is enabled (0.12 = 1).  Auto-Negotiation Enable 0 = Disable auto-negotiate process 1 = Enable auto-negotiate process (overrides 0.13 and 0.8)	R/W	(see Note 1)
11	Power Down 0 = Normal operation 1 = General power down mode	R/W	0b
10	Isolate 0 = Normal operation 1 = Electrical isolation of PHY from the MII/RMII	R/W	0b
9	Restart Auto-Negotiate 0 = Normal operation 1 = Restart auto-negotiate process Note: Bit is self-clearing.	R/W SC	0b
8	Duplex Mode 0 = Half duplex 1 = Full duplex Note: Ignored if Auto-Negotiation is enabled (0.12 = 1).	R/W	(see Note 1)
7	Collision Test 0 = Disable COL test 1 = Enable COL test	R/W	0b
6:0	RESERVED	RO	-

**Note 1:** The default value of this bit is determined by the MODE[2:0] configuration straps. Refer to Section 3.7.2, "MODE[2:0]: Mode Configuration" for additional information.

#### 4.2.2 BASIC STATUS REGISTER

Index (In Decimal): 1 Size: 16 bits

Bits	Description	Туре	Default
15	100BASE-T4 0 = No T4 ability	RO	0b
	1 = T4 able		
14	100BASE-TX Full Duplex 0 = No TX full duplex ability	RO	1b
	1 = TX with full duplex		
13	100BASE-TX Half Duplex 0 = No TX half duplex ability 1 = TX with half duplex	RO	1b
12	10BASE-T Full Duplex 0 = No 10 Mbps with full duplex ability 1 = 10 Mbps with full duplex	RO	1b
11	10BASE-T Half Duplex 0 = No 10 Mbps with half duplex ability 1 = 10 Mbps with half duplex	RO	1b
10	100BASE-T2 Full Duplex 0 = PHY is not able to perform full duplex 100BASE-T2 1 = PHY is able to perform full duplex 100BASE-T2	RO	0b
9	100BASE-T2 Half Duplex 0 = PHY is not able to perform half duplex 100BASE-T2 1 = PHY is able to perform half duplex 100BASE-T2	RO	0b
8	Extended Status 0 = No extended status information in register 15 1 = Extended status information in register 15	RO	0b
7.0		DO.	
7:6	RESERVED	RO	-
5	Auto-Negotiate Complete 0 = Auto-negotiate process not completed 1 = Auto-negotiate process completed	RO	0b
4	Remote Fault 1 = Remote fault condition detected 0 = No remote fault	RO/LH	0b
3	Auto-Negotiate Ability 0 = Unable to perform auto-negotiation function 1 = Able to perform auto-negotiation function	RO	1b
2	Link Status 0 = Link is down.	RO/LL	0b
4	1 = Link is up.	DO#11	O.L.
1	Jabber Detect 0 = No jabber condition detected. 1 = Jabber condition detected.	RO/LH	0b
0	Extended Capabilities 0 = Does not support extended capabilities registers 1 = Supports extended capabilities registers	RO	1b

#### 4.2.3 PHY IDENTIFIER 1 REGISTER

Index (In Decimal): 2 Size: 16 bits

Bits	Description	Туре	Default
15:0	PHY ID Number Assigned to the 3rd through 18th bits of the Organizationally Unique Identifier (OUI), respectively.	R/W	0007h

#### 4.2.4 PHY IDENTIFIER 2 REGISTER

Index (In Decimal): 3 Size: 16 bits

Bits	Description	Туре	Default
15:10	PHY ID Number Assigned to the 19th through 24th bits of the OUI.	R/W	C120h
9:4	Model Number Six-bit manufacturer's model number	R/W	
3:0	Revision Number Four-bit manufacturer's revision number	R/W	

Note: The default value of the Revision Number field may vary dependent on the silicon revision number.

#### 4.2.5 AUTO NEGOTIATION ADVERTISEMENT REGISTER

Index (In Decimal): 4 Size: 16 bits

Bits	Description	Туре	Default
15	Next Page 0 = No next page ability 1 = Next page capable	R/W	0b
14	RESERVED	RO	-
13	Remote Fault 0 = No remote fault 1 = Remote fault detected	R/W	0b
12	RESERVED	RO	-
11:10	Pause Operation 00 = No PAUSE 01 = Symmetric PAUSE 10 = Asymmetric PAUSE toward link partner 11 = Advertise support for both Symmetric PAUSE and Asymmetric PAUSE toward local device	R/W	00b
	<b>Note:</b> When both symmetric PAUSE and asymmetric PAUSE are set, the device will only be configured to, at most, one of the two settings upon auto-negotiation completion.		
9	RESERVED	RO	-
8	100BASE-TX Full Duplex 0 = No TX full duplex ability 1 = TX with full duplex	R/W	(see Note 1)
7	100BASE-TX 0 = No TX ability 1 = TX able	R/W	1b
6	10BASE-T Full Duplex 0 = No 10 Mbps with full duplex ability 1 = 10 Mbps with full duplex	R/W	(see Note 1)
5	10BASE-T 0 = No 10 Mbps ability 1 = 10 Mbps able	R/W	(see Note 1)
4:0	Selector Field 00001 = IEEE 802.3	R/W	00001b

**Note 1:** The default value of this bit is determined by the MODE[2:0] configuration straps. Refer to Section 3.7.2, "MODE[2:0]: Mode Configuration" for additional information.

#### 4.2.6 AUTO NEGOTIATION LINK PARTNER ABILITY REGISTER

Index (In Decimal): 5 Size: 16 bits

Bits	Description	Туре	Default
15	Next Page 0 = No next page ability	RO	0b
	1 = Next page capable		
14	Acknowledge 0 = Link code word not yet received 1 = Link code word received from partner	RO	0b
13	Remote Fault 0 = No remote fault 1 = Remote fault detected	RO	0b
12	RESERVED	RO	-
11:10	Pause Operation 00 = No PAUSE supported by partner station 01 = Symmetric PAUSE supported by partner station 10 = Asymmetric PAUSE supported by partner station 11 = Both Symmetric PAUSE and Asymmetric PAUSE supported by partner station	RO	00b
9	100BASE-T4 0 = No T4 ability 1 = T4 able  Note: This device does not support T4 ability.	RO	0b
8	100BASE-TX Full Duplex 0 = No TX full duplex ability 1 = TX with full duplex	RO	0b
7	100BASE-TX 0 = No TX ability 1 = TX able	RO	0b
6	10BASE-T Full Duplex 0 = No 10 Mbps with full duplex ability 1 = 10 Mbps with full duplex	RO	0b
5	10BASE-T 0 = No 10 Mbps ability 1 = 10 Mbps able	RO	0b
4:0	Selector Field 00001 = IEEE 802.3	RO	00001b

#### 4.2.7 AUTO NEGOTIATION EXPANSION REGISTER

Index (In Decimal): 6 Size: 16 bits

Bits	Description	Туре	Default
15:7	RESERVED	RO	-
6	Receive Next Page Location Able 0 = Received next page storage location is not specified by bit 6.5 1 = Received next page storage location is specified by bit 6.5	RO	1b
5	Received Next Page Storage Location  0 = Link partner next pages are stored in the Auto Negotiation Link Partner Ability Register (PHY register 5)  1 = Link partner next pages are stored in the Auto Negotiation Next Page RX Register (PHY register 8)	RO	1b
4	Parallel Detection Fault 0 = No fault detected by parallel detection logic 1 = Fault detected by parallel detection logic	RO/LH	0b
3	Link Partner Next Page Able 0 = Link partner does not have next page ability. 1 = Link partner has next page ability.	RO	0b
2	Next Page Able 0 = Local device does not have next page ability. 1 = Local device has next page ability.	RO	1b
1	Page Received 0 = New page not yet received 1 = New page received	RO/LH	0b
0	Link Partner Auto-Negotiation Able 0 = Link partner does not have auto-negotiation ability. 1 = Link partner has auto-negotiation ability.	RO	0b

#### 4.2.8 AUTO NEGOTIATION NEXT PAGE TX REGISTER

Index (In Decimal): 7 Size: 16 bits

Bits	Description	Туре	Default
15	Next Page 0 = No next page ability 1 = Next page capable	R/W	0b
14	RESERVED	RO	-
13	Message Page 0 = Unformatted page 1 = Message page	R/W	1b
12	Acknowledge 2 0 = Device cannot comply with message. 1 = Device will comply with message.	R/W	0b
11	Toggle 0 = Previous value was HIGH. 1 = Previous value was LOW.	RO	Ob
10:0	Message Code Message/Unformatted Code Field	R/W	000 0000 0001b

#### 4.2.9 AUTO NEGOTIATION NEXT PAGE RX REGISTER

Index (In Decimal): 8 Size: 16 bits

Bits	Description	Туре	Default
15	Next Page 0 = No next page ability 1 = Next page capable	RO	0b
14	Acknowledge 0 = Link code word not yet received from partner 1 = Link code word received from partner	RO	0b
13	Message Page 0 = Unformatted page 1 = Message page	RO	0b
12	Acknowledge 2 0 = Device cannot comply with message. 1 = Device will comply with message.	RO	0b
11	Toggle 0 = Previous value was HIGH. 1 = Previous value was LOW.	RO	0b
10:0	Message Code Message/Unformatted Code Field	RO	000 0000 0000b

#### 4.2.10 MMD ACCESS CONTROL REGISTER

Index (In Decimal): 13 Size: 16 bits

This register in conjunction with the MMD Access Address/Data Register provides indirect access to the MDIO Manageable Device (MMD) registers. Refer to Section 4.3, "MDIO Manageable Device (MMD) Registers" for additional details.

Bits	Description	Туре	Default
15:14	MMD Function This field is used to select the desired MMD function: 00 = Address 01 = Data, no post increment 10 = RESERVED 11 = RESERVED	R/W	00b
13:5	RESERVED	RO	-
4:0	MMD Device Address (DEVAD) This field is used to select the desired MMD device address. (3 = PCS, 7 = auto-negotiation)	R/W	0h

#### 4.2.11 MMD ACCESS ADDRESS/DATA REGISTER

Index (In Decimal): 14 Size: 16 bits

This register in conjunction with the MMD Access Control Register provides indirect access to the MDIO Manageable Device (MMD) registers. Refer to Section 4.3, "MDIO Manageable Device (MMD) Registers" for additional details.

Bits	Description	Type	Default
15:0	MMD Register Address/Data If the MMD Function field of the MMD Access Control Register is "00", this field is used to indicate the MMD register address to read/write of the device specified in the MMD Device Address (DEVAD) field. Otherwise, this register is used to read/write data from/to the previously specified MMD address.	R/W	0000h

#### 4.2.12 EDPD NLP/CROSSOVER TIME/EEE CONFIGURATION REGISTER

Index (In Decimal): 16 Size: 16 bits

Bits	Description	Туре	Default
15	EDPD TX NLP Enable When in Energy Detect Power-Down (EDPD) mode (EDPWRDOWN = 1), this bit enables the transmission of single TX NLPs at the interval defined by the EDPD TX NLP Interval Timer Select field.  0 = TX NLP disabled 1 = TX NLP enabled when in EDPD mode	R/W NASR	0b
14:13	EDPD TX NLP Interval Timer Select When in Energy Detect Power-Down (EDPD) mode (EDPWRDOWN = 1) and EDPD TX NLP Enable is 1, this field defines the interval used to send single TX NLPs. 00 = 1 second (default) 01 = 768 ms 10 = 512 ms 11 = 256 ms	R/W NASR	00b
12	EDPD RX Single NLP Wake Enable When in Energy Detect Power-Down (EDPD) mode (EDPWRDOWN = 1), this bit enables waking the PHY on reception of a single RX NLP. 0 = RX NLP wake disabled 1 = TX NLP wake enabled when in EDPD mode	R/W NASR	0b
11:10	EDPD RX NLP Max Interval Detect Select When in Energy Detect Power-Down (EDPD) mode (EDPWRDOWN = 1) and EDPD RX Single NLP Wake Enable is 0, this field defines the maximum interval for detecting two RX NLPs to wake from EDPD mode 00 = 64 ms (default) 01 = 256 ms 10 = 512 ms 11 = 1 second	R/W NASR	00b
9:3	RESERVED	RO	-
2	PHY Energy Efficient Ethernet Enable (PHYEEEN) When set, enables Energy Efficient Ethernet (EEE) operation in the PHY. When cleared, EEE operation is disabled. Refer to Section 3.8.4, "Energy Efficient Ethernet" for additional information.	R/W NASR	0b
1	EDPD Extend Crossover When in Energy Detect Power-Down (EDPD) mode (EDPWRDOWN = 1), setting this bit to 1 extends the crossover time by 2976 ms. 0 = Crossover time extension disabled 1 = Crossover time extension enabled (2976 ms)	R/W NASR	Ob
0	Extend Manual 10/100 Auto-MDIX Crossover Time When Auto-MIDX is enabled and the PHY is in manual 10BASE-T or 100BASE-TX mode, setting this bit to 1 extends the crossover time by 1984 ms to allow linking to an auto-negotiation link partner PHY. 0 = Crossover time extension disabled 1 = Crossover time extension enabled (1984 ms)	R/W NASR	1b

#### 4.2.13 MODE CONTROL/STATUS REGISTER

Index (In Decimal): 17 Size: 16 bits

Bits	Description	Туре	Default
15:14	RESERVED	RO	-
13	EDPWRDOWN Enable the Energy Detect Power-Down (EDPD) mode: 0 = Energy Detect Power-Down is disabled. 1 = Energy Detect Power-Down is enabled.	R/W	0b
	<b>Note:</b> When in EDPD mode, the device's NLP characteristics can be modified via the EDPD NLP/Crossover Time/EEE Configuration Register.		
12:10	RESERVED	RO	-
9	FARLOOPBACK Enables far loopback mode (i.e., all the received packets are sent back simultaneously (in 100BASE-TX only)). This bit is only active in RMII mode. This mode works even if the Isolate bit (0.10) is set.  0 = Far loopback mode is disabled.  1 = Far loopback mode is enabled.  Refer to Section 3.8.10.2, "Far Loopback" for additional information.	R/W	0b
8:7	RESERVED	RO	-
6	ALTINT Alternate Interrupt Mode: 0 = Primary interrupt system enabled (Default) 1 = Alternate interrupt system enabled Refer to Section 3.6, "Interrupt Management" for additional information.	R/W	0b
5:2	RESERVED	RO	-
1	ENERGYON Indicates whether energy is detected. This bit transitions to "0" if no valid energy is detected within 256 ms. It is reset to "1" by a hardware reset and is unaffected by a software reset. Refer to Section 3.8.3.2, "Energy Detect Power-Down (EDPD)" for additional information.	RO	1b
0	RESERVED	R/W	0b

#### 4.2.14 SPECIAL MODES REGISTER

Index (In Decimal): 18 Size: 16 bits

Bits	Description	Туре	Default
15	RESERVED	RO	-
14	MIIMODE Reflects the mode of the digital interface: 0 = MII mode 1 = RMII mode	RO	(see Note 1)
13:8	RESERVED	RO	-
7:5	MODE Transceiver mode of operation. Refer to Section 3.7.2, "MODE[2:0]: Mode Configuration" for additional details.	R/W NASR	(see Note 2)
4:0	PHYAD PHY Address. The PHY Address is used for the SMI address and for initialization of the Cipher (Scrambler) key. Refer to Section 3.7.1, "PHYAD[2:0]: PHY Address Configuration" for additional details.	R/W NASR	(see Note 3)

- **Note 1:** The default value of this field is determined by the RMIISEL configuration strap. Refer to Section 3.7.3, "RMIISEL: MII/RMII Mode Configuration" for additional information.
  - 2: The default value of this field is determined by the MODE[2:0] configuration straps. Refer to Section 3.7.2, "MODE[2:0]: Mode Configuration" for additional information.
  - **3:** The default value of this field is determined by the PHYAD[0] configuration strap. Refer to Section 3.7.1, "PHYAD[2:0]: PHY Address Configuration" for additional information.

#### 4.2.15 SYMBOL ERROR COUNTER REGISTER

Index (In Decimal): 26 Size: 16 bits

Bits		Description	Туре	Default
15:0	This 100B code syml only once symbol en	Firror Counter (SYM_ERR_CNT) ASE-TX receiver-based error counter increments when an invalid pol is received, including IDLE symbols. The counter is incremented per packet, even when the received packet contains more than one for. This field counts up to 65,536 and rolls over to 0 if incremented is maximum value.	RO	0000h
	Note:	This register is cleared on reset, but is not cleared by reading the register. It does not increment in 10BASE-T mode.		

#### 4.2.16 SPECIAL CONTROL/STATUS INDICATIONS REGISTER

Index (In Decimal): 27 Size: 16 bits

Bits	Description	Туре	Default
15	AMDIXCTRL HP Auto-MDIX control: 0 = Enable Auto-MDIX 1 = Disable Auto-MDIX (use 27.13 to control channel)	R/W NASR	0b
14	RESERVED	RO	-
13	CH_SELECT Manual channel select: 0 = MDI (TX transmits, RX receives) 1 = MDIX (TX receives, RX transmits)	R/W NASR	0b
12	RESERVED	RO	-
11	SQEOFF Disable the SQE test (Heartbeat): 0 = SQE test is enabled 1 = SQE test is disabled	R/W NASR	0b
10:5	RESERVED	RO	-
4	XPOL Polarity state of the 10BASE-T: 0 = Normal polarity 1 = Reversed polarity	RO	0b
3:0	RESERVED	RO	-

#### 4.2.17 INTERRUPT SOURCE FLAG REGISTER

Index (In Decimal): 29 Size: 16 bits

Bits	Description	Туре	Default
15:8	RESERVED	RO	-
7	INT7 0 = Not source of interrupt 1 = ENERGYON generated	RO/LH	0b
6	INT6 0 = Not source of interrupt 1 = Auto-Negotiation complete	RO/LH	0b
5	INT5 0 = Not source of interrupt 1 = Remote Fault Detected	RO/LH	0b
4	INT4 0 = Not source of interrupt 1 = Link Down (link status negated)	RO/LH	0b
3	INT3 0 = Not source of interrupt 1 = Auto-Negotiation LP Acknowledge	RO/LH	0b
2	INT2 0 = Not source of interrupt 1 = Parallel Detection Fault	RO/LH	0b
1	INT1 0 = Not source of interrupt 1 = Auto-Negotiation Page Received	RO/LH	0b
0	RESERVED	RO	0b

#### 4.2.18 INTERRUPT MASK REGISTER

Index (In Decimal): 30 Size: 16 bits

Bits	Description	Туре	Default
15:8	RESERVED	RO	-
7:1	Mask Bits These bits mask the corresponding interrupts in the Interrupt Source Flag Register. 0 = Interrupt source is masked. 1 = Interrupt source is enabled.	R/W	0000000Ь
0	RESERVED	RO	-

#### 4.2.19 PHY SPECIAL CONTROL/STATUS REGISTER

Index (In Decimal): 31 Size: 16 bits

Bits	Description	Туре	Default
15:13	RESERVED	RO	-
12	Autodone Auto-negotiation done indication: 0 = Auto-negotiation is not done or disabled (or not active). 1 = Auto-negotiation is done.	RO	0b
11:7	RESERVED	RO	-
6	Enable 4B5B 0 = Bypass encoder/decoder 1 = Enable 4B5B encoding/decoding. MAC interface must be configured in MII mode.	R/W	1b
5	RESERVED	RO	-
4:2	Speed Indication HCDSPEED value: 001 = 10BASE-T half-duplex 101 = 10BASE-T full-duplex 010 = 100BASE-TX half-duplex 110 = 100BASE-TX full-duplex	RO	XXXb
1:0	RESERVED	RO	-

#### 4.3 MDIO Manageable Device (MMD) Registers

The device MMD registers adhere to the *IEEE 802.3-2008 45.2 MDIO Interface Registers* specification. The MMD registers are not memory mapped. These registers are accessed indirectly via the MMD Access Control Register and MMD Access Address/Data Register. The supported MMD device addresses are 3 (PCS), 7 (Auto-Negotiation), and 30 (Vendor Specific). Table 4-3, "MMD Registers" details the supported registers within each MMD device.

TABLE 4-3: MMD REGISTERS

MMD Device Address (In Decimal)	Index (In Decimal)	Register Name
3	0	PCS Control 1 Register
(PCS)	1	PCS Status 1 Register
	5	PCS MMD Devices Present 1 Register
	6	PCS MMD Devices Present 2 Register
	20	EEE Capability Register
	22	EEE Wake Error Register
7	5	Auto-Negotiation MMD Devices Present 1 Register
(Auto-Negotiation)	6	Auto-Negotiation MMD Devices Present 2 Register
	60	EEE Advertisement Register
	61	EEE Link Partner Advertisement Register
30	2	Vendor Specific MMD 1 Device ID 1 Register
(Vendor Specific)	3	Vendor Specific MMD 1 Device ID 2 Register
	5	Vendor Specific 1 MMD Devices Present 1 Register
	6	Vendor Specific 1 MMD Devices Present 2 Register
	8	Vendor Specific MMD 1 Status Register
	14	Vendor Specific MMD 1 package ID 1 Register
	15	Vendor Specific MMD 1 package ID 2 Register

To read or write an MMD register, the following procedure must be observed:

- Write the MMD Access Control Register with 00b (address) for the MMD Function field and the desired MMD device (3 for PCS, 7 for Auto-Negotiation) for the MMD Device Address (DEVAD) field.
- 2. Write the MMD Access Address/Data Register with the 16-bit address of the desired MMD register to read/write within the previously selected MMD device (PCS or Auto-Negotiation).
- 3. Write the MMD Access Control Register with 01b (data) for the MMD Function field and choose the previously selected MMD device (3 for PCS, 7 for Auto-Negotiation) for the MMD Device Address (DEVAD) field.
- If reading, read the MMD Access Address/Data Register, which contains the selected MMD register contents. If writing, write the MMD Access Address/Data Register with the register contents intended for the previously selected MMD register.

#### 4.3.1 PCS CONTROL 1 REGISTER

Index (In Decimal): 3.0 Size: 16 bits

Bits	Description	Туре	Default
15:11	RESERVED	RO	-
10	Clock Stop Enable 0 = The PHY cannot stop the clock during Low Power Idle (LPI). 1 = The PHY may stop the clock during LPI.  Note: The device does not support this mode.	R/W	Ob
9:0	RESERVED	RO	1

#### 4.3.2 PCS STATUS 1 REGISTER

Index (In Decimal): 3.1 Size: 16 bits

Bits	Description	Туре	Default
15:12	RESERVED	RO	-
11	TX LPI Received 0 = TX PCS has not received LPI. 1 = TX PCS has received LPI.	RO/LH	0b
10	RX LPI Received 0 = RX PCS has not received LPI. 1 = RX PCS has received LPI.	RO/LH	0b
9	TX LPI Indication 0 = TX PCS is not currently receiving LPI. 1 = TX PCS is currently receiving LPI.	RO	0b
8	RX LPI Indication 0 = RX PCS is not currently receiving LPI. 1 = RX PCS is currently receiving LPI.	RO	0b
7	RESERVED	RO	-
6	Clock Stop Capable 0 = The MAC cannot stop the clock during Low Power Idle (LPI). 1 = The MAC may stop the clock during LPI.	RO	0b
	Note: The device does not support this mode.		
5:0	RESERVED	RO	-

#### 4.3.3 PCS MMD DEVICES PRESENT 1 REGISTER

Index (In Decimal): 3.5 Size: 16 bits

Bits	Description	Туре	Default
15:8	RESERVED	RO	-
7	Auto-Negotiation Present 0 = Auto-negotiation not present in package 1 = Auto-negotiation present in package	RO	1b
6	TC Present 0 = TC not present in package 1 = TC present in package	RO	0b
5	DTE XS Present 0 = DTE XS not present in package 1 = DTE XS present in package	RO	0b
4	PHY XS Present 0 = PHY XS not present in package 1 = PHY XS present in package	RO	0b
3	PCS Present 0 = PCS not present in package 1 = PCS present in package	RO	1b
2	WIS Present 0 = WIS not present in package 1 = WIS present in package	RO	0b
1	PMD/PMA Present 0 = PMD/PMA not present in package 1 = PMD/PMA present in package	RO	0b
0	Clause 22 Registers Present 0 = Clause 22 registers not present in package 1 = Clause 22 registers present in package	RO	0b

#### 4.3.4 PCS MMD DEVICES PRESENT 2 REGISTER

Index (In Decimal): 3.6 Size: 16 bits

Bits	Description	Туре	Default
15	Vendor Specific Device 2 Present 0 = Vendor specific device 2 not present in package 1 = Vendor specific device 2 present in package	RO	0b
14	Vendor Specific Device 1 Present 0 = Vendor specific device 1 not present in package 1 = Vendor specific device 1 present in package	RO	1b
13	Clause 22 Extension Present 0 = Clause 22 extension not present in package 1 = Clause 22 extension present in package	RO	0b
12:0	RESERVED	RO	-

#### 4.3.5 EEE CAPABILITY REGISTER

Index (In Decimal): 3.20 Size: 16 bits

Bits	Description	Type	Default
15:7	RESERVED	RO	-
6	10GBASE-KR EEE 0 = EEE is not supported for 10GBASE-KR. 1 = EEE is supported for 10GBASE-KR.	RO	0b
	Note: The device does not support this mode.		
5	10GBASE-KX4 EEE 0 = EEE is not supported for 10GBASE-KX4. 1 = EEE is supported for 10GBASE-KX4.	RO	0b
	Note: The device does not support this mode.		
4	10GBASE-KX EEE 0 = EEE is not supported for 10GBASE-KX. 1 = EEE is supported for 10GBASE-KX.	RO	0b
	Note: The device does not support this mode.		
3	10GBASE-T EEE 0 = EEE is not supported for 10GBASE-T. 1 = EEE is supported for 10GBASE-T.	RO	0b
	Note: The device does not support this mode.		
2	1000BASE-T EEE 0 = EEE is not supported for 1000BASE-T. 1 = EEE is supported for 1000BASE-T.	RO	0b
	Note: The device does not support this mode.		
1	100BASE-TX EEE 0 = EEE is not supported for 100BASE-TX. 1 = EEE is supported for 100BASE-TX.	RO	(see Note 1)
0	RESERVED	RO	-

Note 1: The default value of this field is determined by the value of the PHY Energy Efficient Ethernet Enable (PHY-EEEEN) of the EDPD NLP/Crossover Time/EEE Configuration Register. If PHY Energy Efficient Ethernet Enable (PHYEEEEN) is 0b, this field is 0b and 100BASE-TX EEE capability is not supported. If PHY Energy Efficient Ethernet Enable (PHYEEEEN) is 1b, then this field is 1b and 100BASE-TX EEE capability is supported.

#### 4.3.6 EEE WAKE ERROR REGISTER

Index (In Decimal): 3.22 Size: 16 bits

Bits	Description	Туре	Default
15:0	EEE Wake Error Counter This counter is cleared to zeros on read and is held to all ones on overflow.	RO/RC	0000h

#### 4.3.7 AUTO-NEGOTIATION MMD DEVICES PRESENT 1 REGISTER

Index (In Decimal): 7.5 Size: 16 bits

Bits	Description	Туре	Default
15:8	RESERVED	RO	-
7	Auto-Negotiation Present 0 = Auto-negotiation not present in package 1 = Auto-negotiation present in package	RO	1b
6	TC Present 0 = TC not present in package 1 = TC present in package	RO	0b

#### 4.3.9 EEE ADVERTISEMENT REGISTER

Index (In Decimal): 7.60 Size: 16 bits

Bits	Description	Туре	Default
15:2	RESERVED	RO	-
1	100BASE-TX EEE 0 = Do not advertise EEE capability for 100BASE-TX. 1 = Advertise EEE capability for 100BASE-TX.	(see Note 1)	(see Note 2)
0	RESERVED	RO	-

Note 1: This bit is read/write (R/W). However, the user must not set this bit if EEE is disabled.

2: The default value of this field is determined by the value of the PHY Energy Efficient Ethernet Enable (PHY-EEEEN) of the EDPD NLP/Crossover Time/EEE Configuration Register on page 57. If PHY Energy Efficient Ethernet Enable (PHYEEEEN) is 0b, this field is 0b and 100BASE-TX EEE capability is not advertised. If PHY Energy Efficient Ethernet Enable (PHYEEEEN) is 1b, then this field is 1b and 100BASE-TX EEE capability is advertised.

#### 4.3.10 EEE LINK PARTNER ADVERTISEMENT REGISTER

#### 5.0 OPERATIONAL CHARACTERISTICS

#### 5.1 Absolute Maximum Ratings\*

Supply Voltage (VDDIO, VDD1A, VDD2A) (see Note 1)	0.5 V to +3.6 V
Digital Core Supply Voltage (VDDCR) (see Note 1)	0.5 V to +1.5 V
Ethernet Magnetics Supply Voltage	-0.5 V to +3.6 V
Positive voltage on input signal pins, with respect to ground (see Note 2)	VDDIO + 2.0 V
Negative voltage on input signal pins, with respect to ground (see Note 3)	0.5 V
Positive voltage on XTAL1/CLKIN, with respect to ground	3.6 V
Storage Temperature	55°C to +150°C
Lead Temperature Range	Refer to JEDEC Spec. J-STD-020
HBM ESD Performance	JEDEC Class 3A

- **Note 1:** When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested that a clamp circuit be used.
  - **2:** This rating does not apply to the following pins: XTAL1/CLKIN, XTAL2, RBIAS.
  - 3: This rating does not apply to the following pins: RBIAS.

#### 5.2 Operating Conditions\*\*

Supply Voltage (VDDIO)	+1.62 V to +3.6 V
Analog Port Supply Voltage (VDD1A, VDD2A)	+3.0 V to +3.6 V
Digital Core Supply Voltage (VDDCR)	+1.14 V to +1.26 V
Ethernet Magnetics Supply Voltage	+2.25 V to +3.6 V
Ambient Operating Temperature in Still Air (T <sub>A</sub> )	(see Note 1)

**Note 1:** 0°C to +70°C for commercial version, -40°C to +85°C for industrial version.

**Note:** Do not drive input signals without power supplied to the device.

#### 5.3 Package Thermal Specifications

#### TABLE 5-1: PACKAGE THERMAL PARAMETERS

Parameter	Symbol	Value	Unit	Comment
Thermal Resistance	$\Theta_{JA}$	47.8	°C/W	Measured in still air from the die to ambient air
Junction-to-Top-of-Package	$\Psi_{JT}$	0.7	°C/W	Measured in still air

Note: Thermal parameters are measured or estimated for devices in a multi-layer 2S2P PCB per JESD51.

<sup>\*</sup>Stresses exceeding those listed in this section could cause permanent damage to the device. This is a stress rating only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at any condition exceeding those indicated in Section 5.2, "Operating Conditions\*\*" or any other applicable section of this specification is not implied. Note, device signals are *NOT* 5.0 V tolerant unless specified otherwise.

<sup>\*\*</sup>Proper operation of the device is guaranteed only within the ranges specified in this section. After the device has completed power-up, VDDIO and the magnetics power supply must maintain their voltage level with ±10%. Varying the voltage greater than ±10% after the device has completed power-up can cause errors in device operation.

#### 5.4 Power Consumption

This section details the device power measurements taken over various operating conditions. Unless otherwise noted, all measurements were taken with power supplies at nominal values (VDDIO, VDD1A, VDD2A = 3.3 V, VDDCR = 1.2 V). See Section 3.8.3, "Power-Down Modes" for a description of the power down modes.

#### 5.4.1 REGULATOR DISABLED

TABLE 5-2: CURRENT CONSUMPTION AND POWER DISSIPATION (REG. DISABLED)

Power Pin Group		3.3 V Device Current (mA)	1.2 V Device Current (mA)	3.3 V Device Current w/ Magnetics (mA)	Total Device Power (mW)
nRESET	Typical	9.7	11	9.7	45
100BASE-TX /W TRAFFIC (NO EEE)	Typical	32	21	74	130
10BASE-T /W TRAFFIC	Typical	11	13	114	51
100BASE-TX IDLE /W EEE	Typical	32	15	32	122
ENERGY DETECT POWER DOWN	Typical	4.0	1.7	4.0	15
GENERAL POWER DOWN	Typical	0.3	1.4	0.4	2.8

#### 5.4.2 REGULATOR ENABLED

TABLE 5-3: CURRENT CONSUMPTION AND POWER DISSIPATION (REG. ENABLED)

Power Pin Group		Device Current (mA)	Device Current w/ Magnetics (mA)	Total Device Power (mW)
nRESET	Typical	21	21	70
100BASE-TX /W TRAFFIC (NO EEE)	Typical	55	97	180
10BASE-T /W TRAFFIC	Typical	25	129	82
100BASE-TX IDLE /W EEE	Typical	48	48	158
ENERGY DETECT POWER DOWN	Typical	7.1	7.1	24
GENERAL POWER DOWN	Typical	4.0	4.0	13

#### 5.5 DC Specifications

Table 5-4 details the non-variable I/O buffer characteristics. These buffer types do not support variable voltage operation. Table 5-5 details the variable voltage I/O buffer characteristics. Typical values are provided for 1.8 V, 2.5 V, and 3.3 V VDDIO cases.

TABLE 5-4: NON-VARIABLE I/O BUFFER CHARACTERISTICS

Parameter	Symbol	Min.	Тур.	Max.	Unit	Note
IS Type Input Buffer						
Low Input Level	V <sub>ILI</sub>	-0.3			V	
High Input Level	V <sub>IHI</sub>			3.6	V	
Negative-Going Threshold	$V_{ILT}$	1.01	1.19	1.39	V	Schmitt trigger
Positive-Going Threshold	$V_{IHT}$	1.39	1.59	1.79	V	Schmitt trigger
Schmitt Trigger Hysteresis (V <sub>IHT</sub> - V <sub>ILT</sub> )	V <sub>HYS</sub>	336	399	459	mV	
Input Leakage (V <sub>IN</sub> = VSS or VDDIO)	I <sub>IH</sub>	-10		10	μΑ	(see Note 1)
Input Capacitance	C <sub>IN</sub>			2	pF	
O12 Type Buffers						
Low Output Level	V <sub>OL</sub>			0.4	V	I <sub>OL</sub> = 12 mA
High Output Level	V <sub>OH</sub>	VDD2A - 0.4			V	I <sub>OH</sub> = -12 mA
ICLK Type Buffer (XTAL1 Input)						(see Note 2)
Low Input Level	V <sub>ILI</sub>	-0.3		0.35	V	
High Input Level	V <sub>IHI</sub>	VDDCR-0.35		3.6	V	

**Note 1:** This specification applies to all inputs and tri-stated bi-directional pins. Internal pull-down and pull-up resistors add ±50 µA per-pin (typical).

<sup>2:</sup> XTAL1/CLKIN can optionally be driven from a 25 MHz single-ended clock oscillator.

TABLE 5-5: VARIABLE I/O BUFFER CHARACTERISTICS

Parameter	Symbol	Min.	1.8 V Typ.	2.5 V Typ.	3.3 V Typ.	Max.	Unit	Note
VIS Type Input Buffer								
Low Input Level	$V_{ILI}$	-0.3					V	
High Input Level	$V_{IHI}$					3.6	V	
Neg-Going Threshold	$V_{ILT}$	0.64	0.83	1.15	1.41	1.76	V	Schmitt trigger
Pos-Going Threshold	$V_{IHT}$	0.81	0.99	1.29	1.65	1.90	٧	Schmitt trigger
Schmitt Trigger Hysteresis (V <sub>IHT</sub> - V <sub>ILT</sub> )	$V_{HYS}$	102	158	136	138	288	mV	
Input Leakage (V <sub>IN</sub> = VSS or VDDIO)	I <sub>IH</sub>	-10				10	μΑ	(see Note 1)
Input Capacitance	C <sub>IN</sub>					2	pF	
VO8 Type Buffers								
Low Output Level	$V_{OL}$					0.4	٧	I <sub>OL</sub> = 8 mA
High Output Level	$V_{OH}$	VDDIO - 0.4					V	I <sub>OH</sub> = -8 mA
VOD8 Type Buffer								
Low Output Level	$V_{OL}$					0.4	٧	I <sub>OL</sub> = 8 mA

**Note 1:** This specification applies to all inputs and tri-stated bi-directional pins. Internal pull-down and pull-up resistors add ±50 µA per-pin (typical).

TABLE 5-6: 100BASE-TX TRANSCEIVER CHARACTERISTICS

Parameter	Symbol	Min.	Тур.	Max.	Unit	Note
Peak Differential Output Voltage High	V <sub>PPH</sub>	950	-	1050	mVpk	(see Note 1)
Peak Differential Output Voltage Low	$V_{PPL}$	-950	-	-1050	mVpk	(see Note 1)
Signal Amplitude Symmetry	$V_{SS}$	98	-	102	%	(see Note 1)
Signal Rise and Fall Time	T <sub>RF</sub>	3.0	-	5.0	ns	(see Note 1)
Rise and Fall Symmetry	T <sub>RFS</sub>	-	-	0.5	ns	(see Note 1)
Duty Cycle Distortion	D <sub>CD</sub>	35	50	65	%	(see Note 2)
Overshoot and Undershoot	Vos	-	-	5	%	
Jitter				1.4	ns	(see Note 3)

- **Note 1:** Measured at line side of transformer, line replaced by 100  $\Omega$  (±1%) resistor.
  - 2: Offset from 16 ns pulse width at 50% of pulse peak.
  - 3: Measured differentially.

TABLE 5-7: 10BASE-T TRANSCEIVER CHARACTERISTICS

Parameter	Symbol	Min.	Тур.	Max.	Unit	Note
Transmitter Peak Differential Output Voltage	V <sub>OUT</sub>	2.2	2.5	2.8	V	(see Note 1)
Receiver Differential Squelch Threshold	$V_{DS}$	300	420	585	mV	

**Note 1:** Min/max voltages guaranteed as measured with 100  $\Omega$  resistive load.

#### 5.6 AC Specifications

This section details the various AC timing specifications of the device.

#### 5.6.1 EQUIVALENT TEST LOAD

Output timing specifications assume a 25 pF equivalent test load, unless otherwise noted, as illustrated in Figure 5-1 below.

FIGURE 5-1: OUTPUT EQUIVALENT TEST LOAD

#### 5.6.2 POWER-ON nRST & CONFIGURATION STRAP TIMING

This diagram illustrates the nRST reset and configuration strap timing requirements in relation to power-on. A hardware reset (nRST assertion) is required following power-up. For proper operation, nRST must be asserted for no less than  $t_{rstia.}$  The nRST pin can be asserted at any time, but must not be deasserted before  $t_{purstd}$  after all external power supplies have reached operational levels. In order for valid configuration strap values to be read at power-up, the  $t_{css}$  and  $t_{csh}$  timing constraints must be followed. Refer to Section 3.8.6, "Resets" for additional information.

#### FIGURE 5-2: POWER-ON nRST & CONFIGURATION STRAP TIMING

TABLE 5-8: POWER-ON nRST & CONFIGURATION STRAP TIMING VALUES

Symbol	Description	Min.	Тур.	Max.	Unit
t <sub>purstd</sub>	External power supplies at operational level to nRST deassertion	25			ms
t <sub>purstv</sub>	External power supplies at operational level to nRST valid	0			ns
t <sub>rstia</sub>	nRST input assertion time	100			μs
t <sub>css</sub>	Configuration strap pins setup to nRST deassertion	200			ns
t <sub>csh</sub>	Configuration strap pins hold after nRST deassertion	1			ns
t <sub>otaa</sub>	Output tri-state after nRST assertion			50	ns
t <sub>odad</sub>	Output drive after nRST deassertion	2		800 (see Note 1)	ns

Note:	nRST deassertion must be monotonic.
Note:	Device configuration straps are latched as a result of nRST assertion. Refer to Section 3.7, "Configuration

Straps" for details. Configuration straps must only be pulled high or low and must not be driven as inputs.

Note 1: 20 clock cycles for 25 MHz, or 40 clock cycles for 50 MHz

#### 5.6.3 MII INTERFACE TIMING

This section specifies the MII interface transmit and receive timing. Please refer to Section 3.4.1, "MII" for additional details.

FIGURE 5-3: MII RECEIVE TIMING

TABLE 5-9: MII RECEIVE TIMING VALUES

Symbol	Description	Min.	Тур.	Max.	Unit	Note
t <sub>clkp</sub>	RXCLK period	(see Note 1)			ns	
t <sub>clkh</sub>	RXCLK high time	t <sub>clkp</sub> * 0.4		t <sub>clkp</sub> * 0.6	ns	
t <sub>clkl</sub>	RXCLK low time	t <sub>clkp</sub> * 0.4		t <sub>clkp</sub> * 0.6	ns	
t <sub>val</sub>	RXD[3:0], RXDV, RXER output valid from rising edge of RXCLK			28.0	ns	(see Note 2)
t <sub>invld</sub>	RXD[3:0], RXDV, RXER output invalid from rising edge of RXCLK	10.0			ns	(see Note 2)

Note 1: 40 ns for 100BASE-TX operation, 400 ns for 10BASE-T operation.

2: Timing was designed for system load between 10 pF and 25 pF.

FIGURE 5-4: MII TRANSMIT TIMING

TABLE 5-10: MII TRANSMIT TIMING VALUES

Symbol	Description	Min.	Тур.	Max.	Unit	Note
t <sub>clkp</sub>	TXCLK period	(see Note 1)			ns	
t <sub>clkh</sub>	TXCLK high time	t <sub>clkp</sub> * 0.4		t <sub>clkp</sub> * 0.6	ns	
t <sub>clkl</sub>	TXCLK low time	t <sub>clkp</sub> * 0.4		t <sub>clkp</sub> * 0.6	ns	
t <sub>su</sub>	TXD[3:0], TXEN, TXER setup time to rising edge of TXCLK	12.0			ns	(see Note 2)
t <sub>hold</sub>	TXD[3:0], TXEN, TXER hold time after rising edge of TXCLK	0			ns	(see Note 2)
t <sub>1</sub>	TXCLK rising edge after TXEN assertion to RXDV assertion (100 Mbps internal loopback mode)	160		162	ns	(see Note 2)

**Note 1:** 40 ns for 100BASE-TX operation, 400 ns for 10BASE-T operation.

2: Timing was designed for system load between 10 pF and 25 pF.

#### 5.6.3.1 100 Mbps Internal Loopback MII Timing

#### FIGURE 5-5: 100 MBPS INTERNAL LOOPBACK MII TIMING

TABLE 5-11: 100 MBPS INTERNAL LOOPBACK MII TIMING VALUES

Symbol	Description	Min.	Тур.	Max.	Unit
•	TXCLK rising edge after TXEN assertion to RXDV assertion (100 Mbps internal loopback MII mode)	160	161	162	ns

**Note:** The t<sub>1</sub> measurement applies in MII mode when the Loopback bit of the Basic Control Register is set to "1" and a link has been established in 100 Mb full-duplex mode. The t<sub>1</sub> measurement is taken from the first rising edge of TXCLK following assertion of TXEN to the rising edge of RXDV.

#### 5.6.4 RMII INTERFACE TIMING

This section specifies the RMII interface transmit and receive timing.

**Note:** The CRS\_DV pin performs both carrier sense and data valid functions. CRS\_DV is asserted asynchronously on detection of carrier due to the criteria relevant to the operating mode. If the PHY has additional bits to be presented on RXD[1:0] following the initial deassertion of CRS\_DV, then the device will assert CRS\_DV on cycles of REF\_CLK which present the second di-bit of each nibble and deassert CRS\_DV on cycles of REF\_CLK which present the first di-bit of a nibble. For additional information, refer to the RMII specification.

#### FIGURE 5-6: RMII TIMING

**TABLE 5-12: RMII TIMING VALUES** 

Symbol	Description	Min.	Тур.	Max.	Unit	Note
t <sub>clkp</sub>	CLKIN period	20			ns	
t <sub>clkh</sub>	CLKIN high time	t <sub>clkp</sub> * 0.35		t <sub>clkp</sub> * 0.65	ns	
t <sub>clkl</sub>	CLKIN low time	t <sub>clkp</sub> * 0.35		t <sub>clkp</sub> * 0.65	ns	
t <sub>oval</sub>	RXD[1:0], RXER, CRS_DV output valid from rising edge of CLKIN			15.0	ns	(see Note 1)
t <sub>oinvld</sub>	RXD[1:0], RXER, CRS_DV output invalid from rising edge of CLKIN	3.0			ns	(see Note 1)
t <sub>su</sub>	TXD[1:0], TXEN setup time to rising edge of CLKIN	4.0			ns	(see Note 1)
t <sub>ihold</sub>	TXD[1:0], TXEN input hold time after rising edge of CLKIN	1.5			ns	(see Note 1)

Note 1: Timing was designed for system load between 10 pF and 25 pF.

#### 5.6.4.1 RMII CLKIN Requirements

TABLE 5-13: RMII CLKIN (REF\_CLK) TIMING VALUES

Parameter	Min.	Тур.	Max.	Unit	Note
CLKIN frequency		50		MHz	
CLKIN Frequency Drift			±50	ppm	
CLKIN Duty Cycle	40		60	%	
CLKIN Jitter			150	ps	p-p – not RMS

#### 5.6.5 SMI TIMING

This section specifies the SMI timing of the device. Please refer to Section 3.5, "Serial Management Interface (SMI)" for additional details.

FIGURE 5-7: SMI TIMING

**TABLE 5-14: SMI TIMING VALUES** 

Symbol	Description	Min.	Max.	Unit
t <sub>clkp</sub>	MDC period	400		ns
t <sub>clkh</sub>	MDC high time	160 (80%)		ns
t <sub>clkl</sub>	MDC low time	160 (80%)		ns
t <sub>val</sub>	MDIO (read from PHY) output valid from rising edge of MDC		300	ns
t <sub>oinvld</sub>	MDIO (read from PHY) output invalid from rising edge of MDC	0		ns
t <sub>su</sub>	MDIO (write to PHY) setup time to rising edge of MDC	10		ns
t <sub>ihold</sub>	MDIO (write to PHY) input hold time after rising edge of MDC	10		ns

#### 5.7 Clock Circuit

The device can accept either a 25 MHz crystal or a 25 MHz single-ended clock oscillator (±50ppm) input. If the single-ended clock oscillator method is implemented, XTAL2 should be left unconnected and XTAL1/CLKIN should be driven with a nominal 0-3.3 V clock signal. The input clock duty cycle is 40% minimum, 50% typical and 60% maximum.

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XTAL1/XTAL2). Either a 300  $\mu$ W or 100  $\mu$ W 25 MHz crystal may be utilized. The 300  $\mu$ W 25 MHz crystal specifications are detailed in Section 5.7.1, "300  $\mu$ W 25 MHz Crystal Specifications". The 100  $\mu$ W 25 MHz crystal specifications are detailed in Section 5.7.2, "100  $\mu$ W 25 MHz Crystal Specifications".

#### 5.7.1 300 μW 25 MHZ CRYSTAL SPECIFICATIONS

When utilizing a 300  $\mu$ W 25 MHz crystal, the following circuit design (Figure 5-8) and specifications (Table 5-15) are required to ensure proper operation.

FIGURE 5-8: 300 μW 25 MHZ CRYSTAL CIRCUIT

TABLE 5-15: 300 µW CRYSTAL SPECIFICATIONS

Parameter	Symbol	Min.	Nom.	Max.	Unit	Note	
Crystal Cut	AT, typ						
Crystal Oscillation Mode	Fundamental	Fundamental Mode					
Crystal Calibration Mode	Parallel Reso	nant Mode					
Frequency	F <sub>fund</sub>	-	25.000	-	MHz		
Frequency Tolerance at 25°C	F <sub>tol</sub>	-	-	±50	ppm	(see Note 1)	
Frequency Stability Over Temp	F <sub>temp</sub>	-	-	±50	ppm	(see Note 1)	
Frequency Deviation Over Time	F <sub>age</sub>	-	±3 to 5	-	ppm	(see Note 2)	
Total Allowable PPM Budget		-	-	±50	ppm	(see Note 3)

XTAL1/CLKIN Pin Capacitance		-	3 typ	-	pF	(see Note 6)	
XTAL2 Pin Capacitance		-	3 typ	-	pF	(see Note 6)	

**Note 1:** The maximum allowable values for frequency tolerance and frequency stability are application dependent. Since any particular application must meet the IEEE ±50 ppm Total PPM Budget, the combination of these two values must be approximately ±45 ppm (allowing for aging).

2: Frequency Deviation Over Time is also referred to as Aging.

- **3:** The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3u as ±50 ppm.
- 4: 0°C for commercial version, -40°C for industrial version
- 5: +70°C for commercial version, +85°C for industrial version
- **6:** This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XTAL1/CLKIN pin, XTAL2 pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. These two external load capacitors determine the accuracy of the 25.000 MHz frequency.

#### 5.7.2 100 μW 25 MHZ CRYSTAL SPECIFICATIONS

When utilizing a 100  $\mu$ W 25 MHz crystal, the following circuit design (Figure 5-9) and specifications (Table 5-16) are required to ensure proper operation.

FIGURE 5-9: 100 μW 25 MHZ CRYSTAL CIRCUIT

TABLE 5-16: 100 μW CRYSTAL SPECIFICATIONS

Parameter	Symbol	Min.	Nom.	Max.	Unit	Note	
Crystal Cut	AT, typ	AT, typ					
Crystal Oscillation Mode	Fundamental	Mode					
Crystal Calibration Mode	Parallel Reso	nant Mode					
Frequency	F <sub>fund</sub>	-	25.000	-	MHz		
Frequency Tolerance at 25°C	F <sub>tol</sub>	-	-	±50	ppm	(see Note 1)	
Frequency Stability Over Temp	F <sub>temp</sub>	-	-	±50	ppm	(see Note 1)	
Frequency Deviation Over Time	F <sub>age</sub>	-	±3 to 5	-	ppm	(see Note 2)	
Total Allowable PPM Budget		-	-	±50	ppm	(see Note 3)	
Shunt Capacitance	Co	-	-	5	pF		
Load Capacitance	C <sub>L</sub>	8	-	12	pF		
Drive Level	P <sub>W</sub>	-	100	-	μW	(see Note 4)	
Equivalent Series Resistance	R <sub>1</sub>	-	-	80	Ω		
XTAL2 Series Resistor	R <sub>S</sub>	495	500	505	Ohm		
Operating Temperature Range		(see Note 5)	-	(see Note 6)	°C		
XTAL1/CLKIN Pin Capacitance		-	3 typ	-	pF	(see Note 7)	
XTAL2 Pin Capacitance		-	3 typ	-	pF	(see Note 7)	

- **Note 1:** The maximum allowable values for frequency tolerance and frequency stability are application dependent. Since any particular application must meet the IEEE ±50 ppm Total PPM Budget, the combination of these two values must be approximately ±45 ppm (allowing for aging).
  - 2: Frequency Deviation Over Time is also referred to as Aging.
  - **3:** The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3u as ±50 ppm.
  - **4:** The crystal must support 100 μW operation to utilize this circuit.
  - 5: 0°C for commercial version, -40°C for industrial version
  - 6: +70°C for commercial version, +85°C for industrial version
  - 7: This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XTAL1/CLKIN pin, XTAL2 pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors (C<sub>1</sub> and C<sub>2</sub> in Figure 5-9). The external load capacitors, C<sub>1</sub> and C<sub>2</sub>, determine the accuracy of the 25.000 MHz frequency.

#### 6.0 PACKAGE OUTLINE

# 32-Lead Very Thin Plastic Quad Flat, No Lead Package (MQ) - 5x5x0.9 mm Body [VQFN] SMSC LEGACY SQFN

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

	Units		IILLIMETER:	S
Dimension	Limits	MIN	NOM	MAX
Number of Terminals	Ν		32	
Pitch	е		0.50 BSC	
Overall Height	Α	0.80	0.90	1.00
Standoff	A1	0.00	0.02	0.05
Terminal Thickness	ninal Thickness A3 0.20 REF			
Overall Width	Е	5.00 BSC

Terminal Length	L	0.35	0.40	0.45
Terminal-to-Exposed-Pad K		0.20	-	-

#### Notes:

- 1. Pin 1 visual index feature may vary, but must be located within the hatched area.
- 2. Package is saw singulated
- 3. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-160B SQFN Sheet 2 of 2

# 32-Lead Very Thin Plastic Quad Flat, No Lead Package (MQ) - 5x5mm Body [VQFN] SMSC LEGACY SQFN

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

#### RECOMMENDED LAND PATTERN

	N	MILLIMETERS		
Dimension	Dimension Limits		NOM	MAX
Contact Pitch	Е		0.50 BSC	
Optional Center Pad Width	X2			3.40
Optional Center Pad Length	Y2			3.40
Contact Pad Spacing	C1		4.90	
Contact Pad Spacing	C2		4.90	
Contact Pad Width (X32)				0.30
Contact Pad Length (X32)				0.85
Contact Pad to Center Pad (X32)	G1	0.33		
Contact Pad to Contactr Pad (X28)	G2	0.20		
Thermal Via Diameter	V		0.33	
Thermal Via Pitch	EV		1.20	

#### Notes:

- Dimensioning and tolerancing per ASME Y14.5M
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
- 2. For best soldering results, thermal vias, if used, should be filled or tented to avoid solder loss during reflow process

Microchip Technology Drawing C04-2160C SQFN

#### APPENDIX A: REVISION HISTORY

REVISION LEVEL & DATE	SECTION/FIGURE/ENTRY	CORRECTION				
Revision A (09-07-15)	Replaces the previous SMSC version Rev. 1.1  • Added Note and Trademark page  • Added Worldwide Sales and Services page					
	<ul> <li>Added Product Identification System</li> <li>Changed 'QFN' to 'VQFN'</li> </ul>					
	Chapter 2, "Pin Description and Configuration"	Figure 2-1: rotated 90° cw     Table 2-3, "Serial Management Interface (SMI)     Pins": Changed "VIS/VOD8 (PU)" to "VIS/VO8 (PU)"				
	Section 4.1, "Register Nomenclature"	Table 4-1, "Register Bit Types", register bit description for byte type notification 'W': Changed "read" to 'written"				
	Section 5.6.4, "RMII Interface Timing"	Updated RMII timing table: Updated REF_CLK In mode t <sub>oval</sub> max from "14.0 ns" to "15.0 ns"				
	Section 5.7, "Clock Circuit"	Added new 100 $\mu$ W crystal specifications and circuit diagram. The section is now split into two subsections, one for 300 $\mu$ W crystals and the other for 100 $\mu$ W crystals.				
	Chapter 6, "Package Outline"	Updated package outline drawing information				
Rev. 1.1 (05-21-13)	General	Changed part numbers from     "LAN8741/LAN8741i" to     "LAN8741A/LAN8741Ai"				
		<ul><li>Updated ordering information</li><li>Updated figures</li></ul>				
	Cover	Added new bullet under Highlights section: "Deterministic 100 Mb internal loopback latency (MII Mode)"				
	Chapter 2, "Pin Description and Configuration", Table 2-1, "MII/RMII Signals"	Changed buffer type from "VIS (PU)" to "VIS"				
	Chapter 2, "Pin Description and Configuration", Table 2-3, "Serial Management Interface (SMI) Pins"	<ul> <li>Added pull-up to MDIO buffer type description</li> <li>Changed "VIS/VOD8 (PU)" to "VIS/VO8 (PU)"</li> </ul>				
	Section 3.3, "HP Auto-MDIX Support"	Changed "100BASE-T" to "100BASE-TX"				
	Section 3.4.2.1, "CRS_DV - Carrier Sense/Receive Data Valid"	Changed "100BASE-X" to "100BASE-TX"				
	Section 3.5, "Serial Management Interface (SMI)"	Removed sentence stating "Non-supported registers (such as 7 to 15) will be read as hexadecimal "FFFF".				
	Section 3.8.10.1, "Near-end Loopback"	Added cross-reference to 100 Mbps internal loopback timing section				
	Section 4.2.2, "Basic Status Register"	Updated definitions of bits 10:8				
	Section 4.2.16, "Special Control/Status Indications Register"	Updated bit 11 definition				
	Section 4.2.19, "PHY Special Control/Status Register"	Updated bit 6 definition				
	Section 4.3, "MDIO Manageable Device (MMD) Registers"	Added additional vendor specific MMD register descriptions				
	Chapter 5, "Operational Characteristics"	Removed section "Power Sequence Timing"				

REVISION LEVEL & DATE	SECTION/FIGURE/ENTRY	CORRECTION
Rev. 1.1 (05-21-13)	Section 5.1, "Absolute Maximum Ratings*"	Changed: Positive voltage on XTAL1/CLKIN, with respect to ground from "VDDCR" to "+3.6V"
	Section 5.3, Table 5-1, "Package Thermal Parameters"	Updated package thermal specification values
	Section 5.4, "Power Consumption"	Updated power numbers
	Section 5.5, "DC Specifications"	Changed V <sub>IHI</sub> max of ICLK Type Buffer from "VDDCR" to "3.6"
	Section 5.6, "AC Specifications"	Removed two RMII notes at beginning of section
	Section 5.6.3.1, "100 Mbps Internal Loopback MII Timing"	Added new 100 Mbps internal loopback timing section and diagram
	Section 5.6.4, "RMII Interface Timing"	<ul> <li>Added note detailing CRS_DV behavior as both carrier sense and data valid</li> <li>Updated RMII timing table</li> </ul>
Rev. 1.0 (05-11-12)	Initial Release	•

NOTES:

#### THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at <a href="www.microchip.com">www.microchip.com</a>. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's
  guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

#### **CUSTOMER CHANGE NOTIFICATION SERVICE**

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at <a href="www.microchip.com">www.microchip.com</a>. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

#### **CUSTOMER SUPPORT**

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- · Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

#### PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

[XX]<sup>(1)</sup> PART NO. [X] <u>XX</u> **Device** Temperature Package Tape and **Reel Option** Range Device: LAN8741A Temperature Blank =  $0^{\circ}$ C to + $70^{\circ}$ C Range: = -40°C to +85°C Package: EN = VQFN (32-pin) Blank = Standard packaging (tray)
TR = Tape and Reel<sup>(1)</sup> Tape and Reel Option:

#### Examples:

- a) LAN8741A-EN 0°C to +70°C, (32-pin), Tray
- b) LAN8741Ai-EN -40°C to +85°C, (32-pin), Tray
- c) LAN8741A-EN-TR 0°C to +70°C, (32-pin), Tape and Reel
- Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option. Reel size is 5,000.

#### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

#### **Trademarks**

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELoQ, Iogo, Kleer, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC<sup>32</sup> logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

The Embedded Control Solutions Company and mTouch are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, ECAN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, KleerNet, KleerNet logo, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, RightTouch logo, REAL ICE, SQI, Serial Quad I/O, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

# QUALITY MANAGEMENT SYSTEM CERTIFIED BY DNV == ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

#### Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

**«JONHON»** (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
